MODERN WEAPON SYSTEMS

Depend on Reliable Technical Manuals!

Reliability is the key factor stressed more and more in military equipment procurement, especially for components of modern weapon systems. Maintaining equipment reliability in the field requires Technical Manuals of exceptional quality. The thinking of the military on this point is clearly reflected in the following quotation from Specification MIL-M-005474B:

"Modern weapon systems and support equipment represent a vastly increased complexity in equipment, with the result that each manual MUST be, and shall be, engineered as carefully as the equipment which it covers; sufficient time, thought and energy shall be expended to make it so. In sharp contrast with any idea that technical manuals can be a "cheap and dirty" effort in a program involving design and production of costly and complex equipment, a new high standard shall be sought in the development of technical manuals produced to this specification. The cost of operation and maintenance can skyrocket when Service personnel fail to 'get the word,' that is, when they fail to get clearly understandable, well-written and well-illustrated manuals."

We are gratified to note this firm statement of policy since it defines a quality of service and product which is standard with Spruce Co. Each project, large or small, is directed by a publication engineer supported by quality control procedures and complete production facilities. With this approach we are able to consistently produce the accurate, readily understandable and well illustrated technical manuals demanded by the military.

For additional information about the many technical data services offered by R. Spruce Co., write today for the informative brochure "Technical Publications by Spruce."

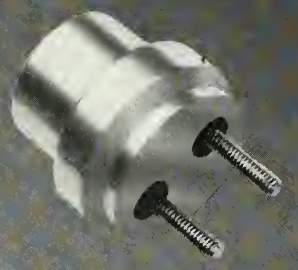
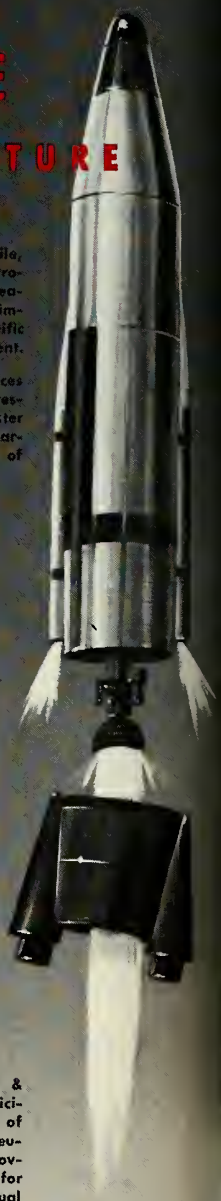
Avco and a Modern Minuteman—Recent work at Avco led to a solution of the missile reentry problem, and to production of the nose cone for the Air Force Titan ICBM. Now the Air Force announces a development program for Minuteman, a solid fuel missile that will be capable of instantaneous firing with no preparatory fueling delays. Its nose cone, too, will come from Avco's Research and Advanced Development and Lycoming Divisions . . . implementing this modern Minuteman's vigilant defense of our shores.

UNUSUAL CAREER OPPORTUNITIES FOR QUALIFIED SCIENTISTS AND ENGINEERS . . . WRITE AVCO TODAY.

Avco

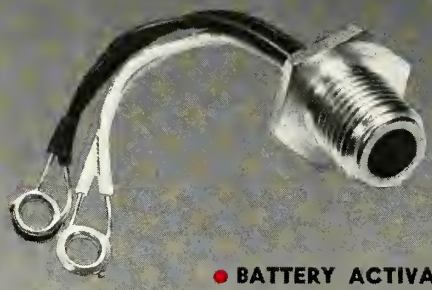


CO MAKES THINGS BETTER FOR AMERICA / AVCO CORPORATION / 750 THIRD AVENUE, NEW YORK 17, N.Y.



Mc/S/A EXPLOSIVE ORDNANCE

IN STEP WITH THE FUTURE



The powerful ATLAS Intercontinental Ballistic Missile, built for the United States Air Force by Convair-Astronautics, has proven its reliability as a military weapons system. In addition, it will soon lift man himself into interplanetary space in search of scientific knowledge of our solar system and its environment.

McCormick Selph Associates explosive ordnance devices play a major role in the ATLAS system — M-92 pressure cartridges actuate the twin-chambered booster engine separation system, and battery actuation cartridges allow power to be generated for operation of systems within the *missile nose cone.

● M-92 PRESSURE CARTRIDGES

● BATTERY ACTIVATION CARTRIDGES

Mc/S/A devices such as M-92 pressure cartridges & battery activation cartridges will operate with efficiency and reliability at all altitudes and any extreme of temperature; can be mechanically, electrically or pneumatically initiated and will meet the most rigid government, industry or other specifications. Write for detailed technical data applicable to your individual problems.

*Nose cone supplied by General Electric, Missile and Space Division

EXPLOSIVE ORDNANCE

for Communications

on the Missile Base Complex..

come to the experts!

DuKane electronic communication systems provide the vital network of instant voice communication which literally ties together such installations as Fort Churchill, Patrick AFB, and White Sands. DuKane offers the broadest, most flexible, most versatile line of custom-installed communication systems in the industry. For an installation involving a few persons, or hundreds, DuKane's experts can help you design and specify a communication system which will fill your needs. Why not ask for their help? *Write or wire DuKane Corporation, Dept.MR-3, St. Charles, Illinois*

If you specify electronic equipment, ask also for DuKane's chart of electronic equipment symbols.

DuKane Products are installed and serviced by a nationwide network of factory-trained experts

communications systems . . . Ionovac hi-fi tweeters and ultrasonic generators . . . Sound slidefilm projectors for educa
and industry . . . Electronic production facilities for industry and for defense.

The Pentadome structure, developed by an industrial team in cooperation with the U. S. Army Quartermaster Corps, was designed to meet Ordnance Corps requirements for a missile maintenance shelter.

NEW BIRDAIR STRUCTURE
to guard our nation's defenses

COOPERATING MANUFACTURERS

Nylon Base Fabric by
WELLINGTON SEARS CO.
11 WEST 40th STREET • NEW YORK 18, NEW YORK

pecial fabric construction for the Pentadome was supplied by Wellington Sears, manufacturers of famous Welkote" nylon fabric specially engineered for vinyl nd neoprene coating.

Coated Fabric by
THE H. M. SAWYER DIVISION
SAWYER-TOWER, INC.
WATERTOWN 72, MASSACHUSETTS

pecial vinyl coating compounds and their application meet rigid military specifications were provided y Sawyer for the Pentadome. Sawyer's "Tuff-Tarp" world renowned for its excellent properties and igh quality.

Inflation Equipment by
HE PEERLESS ELECTRIC CO.
1401 W. MARKET STREET • WARREN, OHIO

he "heart" of the Pentadome, its inflation and its ressurization blowers, were provided by Peerless, uilders of a complete line of high quality air moving uipment ... fans, blowers, and electric motors.

This is Pentadome, the largest air-supported structure ever built for military use. It is made up of five — one large, and four small — domes which can be used either in combination, or individually.

The main dome is 150 feet in diameter and 85 feet high; the smaller domes, 100 feet in diameter and 50 feet high. A total ground area of 50,000 sq. ft. and volume of over 2,000,000 cu. ft. are protected.

With vinyl-coated nylon fabric as the basic construction material, shape and stability are attained (and maintained) through constant low-pressure, high-volume, air supplied by electric powered blowers.

Thus, *no* rigid supports, poles or frames are needed. There are no obstructions to hinder the free movement of missiles or other large pieces of equipment.

The Pentadome is held in place by anchors driven into the ground around its perimeter. It is designed to withstand a constant wind load of 70 miles per hour and gust loads of greater velocity.

Ten men, during a single working day, can erect the Pentadome, after proper anchorage installations have been made. A deflated Pentadome can be transported on standard military vehicles.

Although developed as missile inspection and maintenance shelter, the Pentadome configuration appears to have many other military and commercial applications. For example, experts have suggested its use as a storage enclosure, as a protection for construction activities, and as an exhibit enclosure.

If you have a problem that might be solved with this new approach to space enclosure, we will be glad to send complete specifications, or to arrange a conference at your convenience. Address inquiries to:

BIRDAIR STRUCTURES, INC.
Dept. MR-1, 290 Larkin St., Buffalo 10, N. Y.
Originators of Modern Air Supported Structures

foremost designers and manufacturers of telemetry receivers

NEMS • CLARKE

hos been designing ond monufocturing precision electronic equipment since 1909 when it first produced communications devices for the United Stotes Government. This holf-century of experience is recognized by government and industry alike. *Today more than 95% of the telemetry receivers in use ot United States missile test stations and ronges were designed and built by Nems-Clarke.* Among mony installotions now using this equipment are:

PATRICK AIR FORCE BASE

VANDENBERG AIR FORCE BASE

WHITE SANDS MISSILE RANGE

EGLIN AIR FORCE BASE

ARMY BALLISTIC MISSILE AGENCY

We welcome inquiries on problems in the telemetry field

A Long Look at Renegotiation

Congress this week is considering legislation of tremendous significance to our space efforts and to our national security. This is legislation to extend the Renegotiation Act of 1951.

The House has passed HR 7086, which extends the Renegotiation Act for a period of four years, and the bill is now under consideration by the Senate Finance Committee.

The purpose of renegotiation is to provide for an after-the-fact review of all defense and applicable contracts to assure that the contractors do not make excessive profits. The Act itself is unique in that for all practical purposes it gives one agency of the government the power to overrule decisions of another government department.

In recent hearings before the House Ways and Means Committee, all of the testimony submitted by industry—both large and small—recommended against extension of the Act or called for its substantial modification to provide for precise definition of excessive profits.

Representatives of the Department of Defense, the Air Force and the Renegotiation Board itself—Robert Dechert, DOD general counsel; Max Golden, USAF general counsel, and Renegotiation Board Chairman Thomas Coggeshall—recommended to the committee a continuation of the Act for a period of two years and three months, or until Sept. 1, 1961.

Chief proponent of permanency for the Renegotiation Act was Congressman Carl Vinson, Chairman of the House Armed Services Committee.

The proposal for a long extension of the Act—and the recommendation that it be made permanent—obviously imply that the aircraft/missile/space industry is and has been making excessive profits. This assumption is not substantiated by the available facts and may be due to the hypnotic affect of large figures.

Boeing, for instance, earned in 1958 a profit of $29 million. That's a huge sum. But it was only 1.72% of net sales. A smaller company making a profit of $29 thousand at 1.72% wouldn't attract anybody's attention.

Actually, the earnings of the aircraft/missile/space industry historically have been substantially less than those of other manufacturers. Since 1951, when the Act was first passed, they have been less than half the average earnings recorded by all manufacturing companies in the U.S.

Lockheed Aircraft Corporation in 1958 devoted 40% of its effort to missile and space work and in so doing faced a tremendous expansion program. Robert E. Gross, chairman of the board, told the committee:

"In the last three years . . . we have spent $56 million of our own funds on plant additions, and the dollar value of company-owned facilities has increased 64%. I might point out that in these same three years our total earnings after taxes amounted to just $50 million."

In a comprehensive study of the same companies whose profits in many cases the Renegotiation Board is now finding excessive, the Investigating Subcommittee (Chairmanned by Congressman Hébert) of the House Armed Services Committee, on July 13, 1956, reported:

"The Subcommittee concludes on the evidence that there has been no showing that on the average the profits allowed are excessive."

This report, incidentally, was signed by Carl Vinson, then as now chairman of the House Armed Services Committee, and now leading the proponents of permanent re-enactment or lengthy extension of the Renegotiation Act.

Since the 1956 report, both the Hébert Subcommittee and the House Committee on Ways and Means, which has actual jurisdiction, have recommended that studies and a review of the entire renegotiation process, including the Act and its administration, be undertaken. No such review has been made or attempted.

We are in complete agreement that management of our public funds is a matter for the closest official scrutiny. We believe that it is of the utmost importance to our national security and our economy that proper and adequate measures be established to insure that no industry makes excessive profits from government contracts.

Equally, we are concerned with the health and welfare of the aircraft/missile/space industry, which has the primary responsibility for providing the vehicles essential to our national security—and national prestige. Industry will not maintain its responsibility if it does not equally maintain a healthy financial condition.

We would therefore urge the Senate, which has the immediate action in the matter, to extend the Renegotiation Act—but only for one year.

We would further urge that Congress institute during that year the studies recommended by the two committees—studies not of the principle of recovering excessive profits, but of establishing an equitable formula for this recovery.

This seems to us the only fair way to resolve the wide divergencies of opinion which exist between government and industry and within government itself.

engine power
BY CATERPILLAR

THEY DEPEND ON CAT DIESEL POWER T
KEEP AIR FORCE ATLAS MISSILE ON TARGE

Calibration of the delicate electronic system of an Atlas missile requires a portable power source with unusually accurate control of voltage.

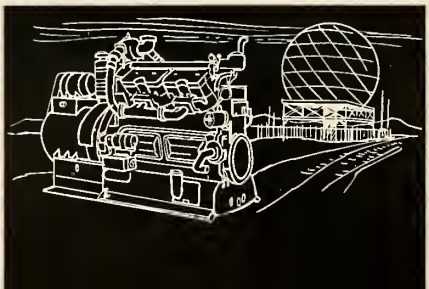
Down-range tracking stations need a power supply that can be depended upon in *any* emergency.

Both requirements are met by Caterpillar Diesel Electric Sets. Caterpillar Diesel Engines in these sets are extremely efficient 4-cycle engines which operate on any fuel from JP-4 through No. 2 furnace oil. They start easily, pick up load quickly and can be maintained and operated by unskilled personnel. Parts—and service—are available all over the Free World.

These are some of the reasons why you will see so many Caterpillar Electric Sets used for primary and standby power at our missile bases and other military establishments. They are used to supply power for testing, for starting jet engines, for radar warning systems, for lighting, heating and other base living facilities.

Free booklet. Get the full story on the advantages of Caterpillar Diesel Electric Sets. Write to Engine Division, Caterpillar Tractor Co., Peoria, Illinois, U. S. A.

Caterpillar and Cat are Registered Trademarks of Caterpillar Tractor Co.



At Edwards Air Force Base in California, power for testing th precision electronic control circuits of the Atlas missile is supplie by two Cat D375 Diesel Electric Sets. They meet the triple r quirement of portability, dependability and accurate contro

JET ASSIST. Caterpillar Portable Electric Sets supply dependable power for starting jet engines and for calibrating control systems.

ALONE. Without benefit of people to look after them, Cat Electric Sets furnish power for gap filler sites in our aircraft warning system. They are used at larger bases, too.

ENDURANCE. At Air Force Bases in t Atlantic, Cat Electric Sets have run o 20,000 hours without overhaul, wh supplying 68,000 kwh a month.

washington countdown

The Air Force successfully launched ARPA's *Discoverer III* June 3. The satellite carried four two-month old male mice—each wearing a small instrumented saddle. (See page 28)

IN THE PENTAGON

The budget-minded Administration appears to have no intention of buying an extra eight Convair *Atlas* squadrons as recommended by the House Appropriations Committee. They would cost about $800 million—a long way from the $85 million "downpayment" added to the defense appropriations bill by the committee.

• • •

The Martin *Mace-B*—also considered for use by European NATO troops—has substantially greater range than the more than 750-mile *Mace-A* and operates on a new inertial guidance system. In fact, the much extended range of the *Mace-B* is reported to be forcing the Air Force to transfer testing from Holloman AFB, New Mexico, to Cape Canaveral.

• • •

The $127,500,000 slashed by the House Appropriations Committee from the Air Force's *Mace* program would virtually strangle production of the *Mace-B*. But the cut would not halt the flow of *Mace-A's* to U.S. troops in Europe where they are taking the place of the *Matador*.

• • •

One of the big problems facing scientists working on feasibility studies for ARPA's Project *Orion* is radiation and fallout. *Orion*—a proposed multi-kiloton space platform—would be launched by a series of controlled nuclear explosions. General Atomic Division of General Dynamics is conducting the studies.

• • •

One of the main arguments being used by some top Pentagon scientists against the Western Electric *Nike-Zeus* is that it cannot cope with the vastly complicated ICBM threat expected by the mid-1960's. They argue that defense against a small number of ICBM's and radar decoys is one thing. But the attack they foresee, involving hundreds of warheads, jammers and decoys, is quite another.

A major reorganization of the Air Force Weapons Board involves establishment of advisory and review panels based on complete weapon systems. These include not only the weapon and related facilities but also personnel, training, maintenance and supply.

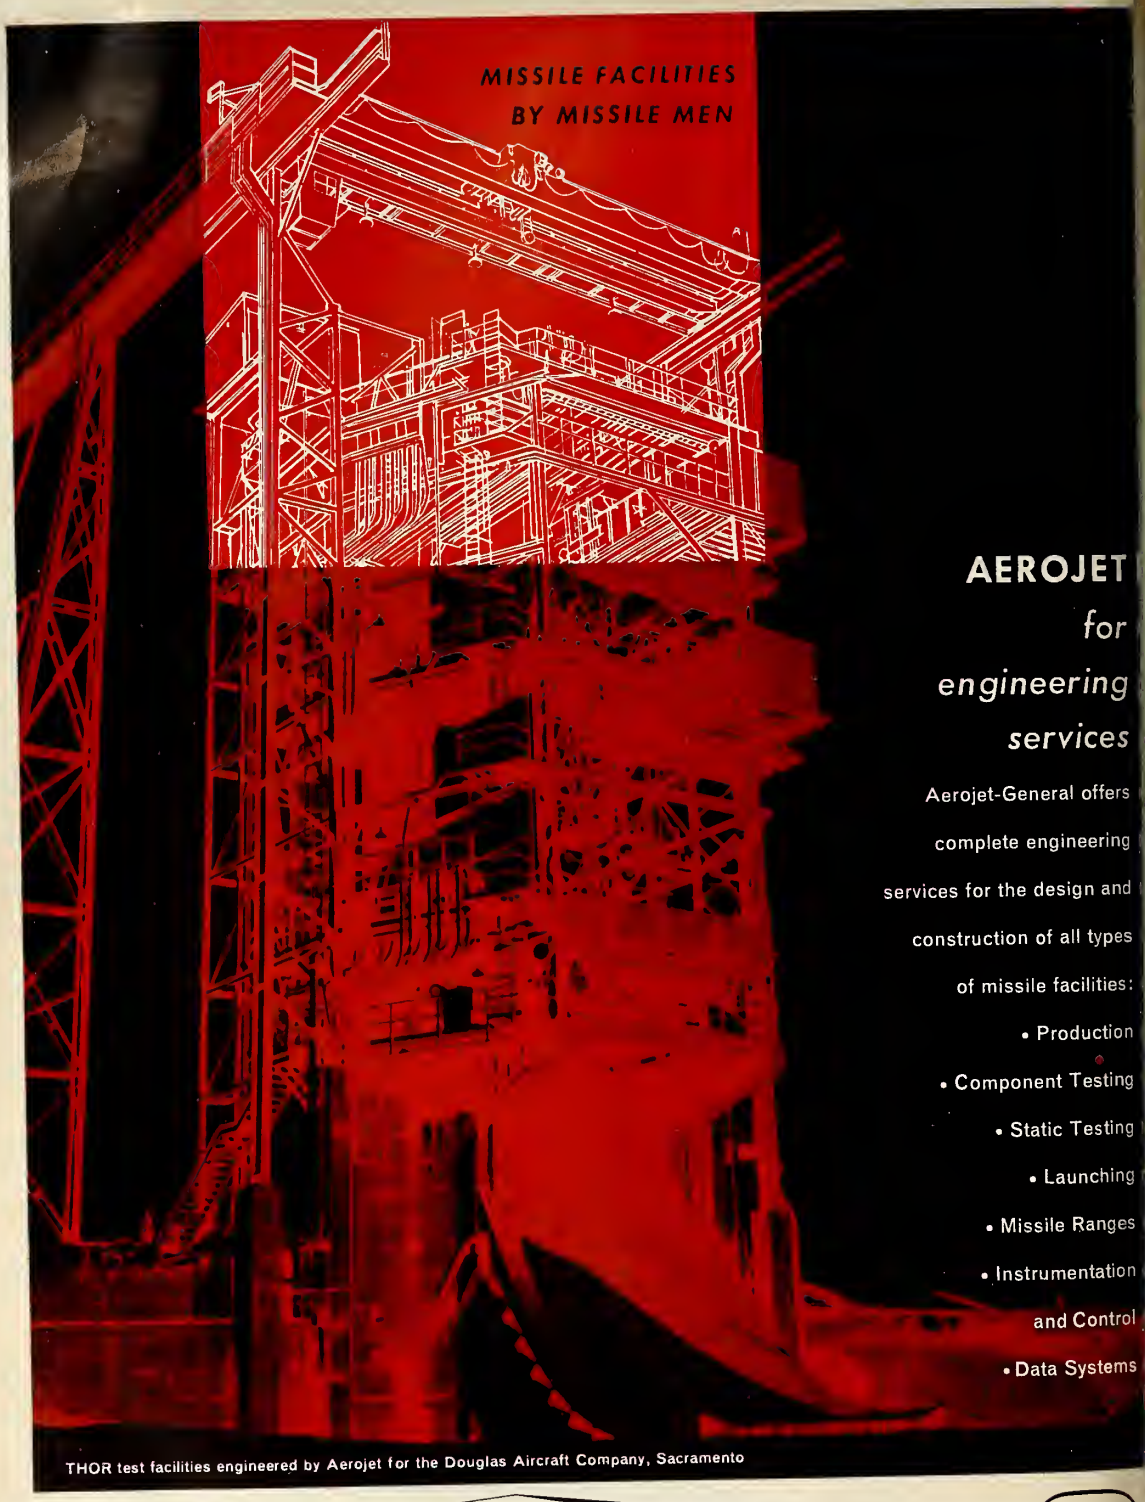
ON CAPITOL HILL

The House's deep cuts in the Boeing *Bomarc* program and the Senate's deep cuts in the Western Electric *Nike-Hercules* program are seen more as pressure plays than economy. Congressmen are tired of pumping billions into both the Air Force and Army programs. Now they are putting it to the Pentagon at point blank range: Make up your mind.

• • •

The flight of Baker and the late Able has stirred up a new congressional secrecy investigation. The House Information Subcommittee will soon be asking Pentagon and NASA officials to explain why space monkey business is secret some days and not on others.

AT NASA



Scientists at NASA have scheduled a satellite launching a week for three weeks beginning with one about mid-June. First will be a new attempt to launch *Vanguard III* with its extra proton-free precession magnetometer carrying an extra-sensitive magnetometer and an inflatable 30-inch balloon. Second will be *Explorer VI*. Third will be *Thor-Able III*—a space probe.

• • •

Two deep space probes—*Thor-Able IV* and *Atlas-Able IV*—are scheduled for later in July and August. Both are expected to follow *Mechta* and *Pioneer IV* into solar orbits. Scientists expect to be able to track them farther than either of the first two solar-powered satellites because they will be powered by greatly improved solar cells.

AROUND TOWN

U.S. officials say privately that Russian Premier Khrushchev's threat to establish missile bases in Albania is 100-proof Soviet hogwash. Reason: Russia already has submarine bases in Albania, and the Red subs are capable of launching missiles.

industry countdown

Cash position of missile/aircraft manufacturers will improve substantially under Air Force decision to ease requirements for liquidation of progress payments. Order has been forwarded from USAF headquarters to Air Materiel Command requiring that the rate at which advances must be liquidated will be subject to negotiation. Order is effective July 1 and covers both new contracts and deliveries made after that date. During 1957 drive to stay under national debt ceiling, progress payments were limited to 70% of incurred cost. As a result, 70% of the delivery price (on fixed price contracts) was withheld until progress payments previously made were fully liquidated by the company. New AF Procurement Instruction will spell out the new rules, which seemingly would allow contractors to retain up to 85% of earned profit on deliveries without running afoul liquidation of progress payment rules.

STRUCTURES

Team that actually wins *Dyna-Soar* development contract, insiders say, probably will be a "mixture" of members of the two teams in the contest. One team is headed by Boeing and the other by Martin and Bell Aircraft. Air Force scramble conceivably could split Martin and Bell; would be aimed at putting together best combination of subsystems contractors. One high Pentagon official says concepts for the rocket-boosted manned glider are so similar "you could put 'em all out on a table and not be able to tell them apart." Announcement of the contract is due shortly.

• • •

Wage demands for forthcoming bargaining talks with missile/aircraft and electronic employers will be hammered out at the first joint conference of the International Association of Machinists and United Auto Workers Unions starting Aug. 5 at Kansas City. Both UAW's Walter P. Reuther and IAM president Al Hayes will address conference delegates representing 600,000 missile industry employes. Joint action of the two unions follows six years of individual, but coordinated collective bargaining under a mutual assistance pact.

• • •

Industry observers are wondering if the naming of retired AF procurement chief Lt. Gen. C. S. (Bill) Irvine as a v.p. and planning director of Avco means the company will expand on the West Coast. Irvine has indicated he will headquarter in California and friends believe he hasn't switched plans.

PROPULSION

Look for E. I. duPont to get into solid fuel development race. Military officials have been wondering why the big chemical concern hasn't moved sooner . . . Meantime, Astrodyne Corp., McGregor, Texas, has won a $2 million AF contract for solid propellants.

ARPA is investing about $14 million in solid fuel research during fiscal 1959. Biggest percentage of the funds will be spent with private industry.

ELECTRONICS

Lockheed is the Air Force contractor on *Midas* and *Sentry* projects. Funding amounts to $10.8 million for *Midas* and $98.6 million for *Sentry* during 1959 FY. Air Force is executive agent for ARPA on the projects.

• • •

Answer to frequency spectrum and bandwidth saturation problem are new devices under development for analyzing data before transmission. STL's Dr. George C. Mueller says these new telemetry techniques would reduce bandwidth requirements by 1000 to 1.

• • •

Near perpetual motion temperature-operated clock went to W. J. (Jim) Mayo-Wells of the National Bureau of Standards—winner of the first annual telemetering award of the National Telemetering Conference. He initiated the first industry-military telemetering conference back in 1948.

ASTROPHYSICS

Analysis of photographic plates exposed to radiation 770 miles in space indicates inner Van Allen belt consists of masses of protons with a level of 1 roentgen per hour. University of California Radiation Laboratory physicists Dr. R. Stephen White and Dr. Stanley C. Freden found most of the protons had energies around 75 mev; 10% were in 300 mev range and about 1% were 700 mev or greater.

• • •

White and Freden calculate at 2000 miles radiation intensity rises to 100 roentgens per hour. This would yield in four hours a fatal exposure to an unshielded space traveler. Ten photographic plates measuring slightly less than two inches square were rocketed into space aboard a *Thor-Able* launched from Cape Canaveral in April. They were recovered along with the nose cone.

Army Expanding 'Breakout' Policy

Congress sees increased opportunities for small business with Army taking 'standardized' components away from primes and buying under competitive bidding

by Erica M. Karr

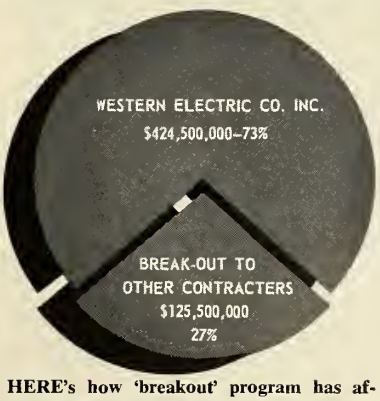
WASHINGTON—The Army's greatly epped-up "breakout" policy, recently vealed in hearings before the House efense Appropriations Subcommittee, bound to jostle to some extent the tire structure of its missile procure- ent pyramid.

Breakout is the process through hich missile components, as they be- me stabilized are taken away om the prime contractor and con- cted for directly by the Army. Esti- ated savings, the Army says, will n to hundreds of millions of dollars en its hoped-for goal of 50% break- ct on missile systems is reached.

Affected is the prime, his subcon- ctors, the Army's own procurement s up and, Congress hopes, the tax- p er.

Prodded last year by a Congress hich felt that the primes were get- ti too much, the Army, which had b n making small motions in the d ection of breakout, went all-out u ler an August, 1958, directive from th Deputy Chief of Staff for Logistics. T e directive stresses early identifica- ti n of components "susceptible to b akout," and the encouragement of p ne contractors to "identify items a components which can be pro- c d on a competitive basis in order to broaden the subcontracting struc- tu ."

Latest Army procurement policies ar spelled out in a directive dated M ch 23, 1959 (#145-715). It will re ain in effect for two years.



• **Shopping around**—With or with- ou his help, the prime contractor who wa given the whole pie in the be- gi ing is likely to find pieces nibbled aw y. If he or his subcontractor have de loped a piece of missile-related ha ware to the proven-out stage, he may well find it missing from the renewal contract next time around, because the Army has shopped around and found itself a better deal.

He may also find his proprietary items designed out of the system. Despite the fact that he will have no control over many important components in the system, he will be charged with responsibility for overall system reliability.

Moneywise, he stands to lose the approximate 3 to 6% profit he was making by riding herd on the subcontractor—about 10% if it was an "in-house" item.

Does the subcontractor make more profit if he deals directly with the Government? Possibly less, says the Army, since it is likely to scout the market more carefully to get the best possible price.

• **Savings touted**—The Army procurement staff will have to be stepped up to administer its increasing responsibility as that of the primes decrease. But the Army claims that the added administrative costs will be a drop in the bucket, compared to the savings.

HERE's how 'breakout' program has affected Western Electric's *Nike-Hercules* program.

The Army points out that breakout of *Nike-Hercules* components from prime Western Electric has so far resulted in a savings of about $4.7 million despite the increase in Government's administrative costs. Estimate on total savings for *Nike-Hercules* runs to $20 million and, Army points out, this does not include savings through competition. Western Electric, which started with 84% of the program, is now down to 73%.

Another example is *Sergeant*, scheduled for a final breakout within two years which will cut down Sperry Utah Engineering Lab, awarded 91% of the $40 million funded in Fiscal 1959, to 71%.

In addition, the Army anticipates a 30% dollar breakout from prime contractors on *Hawk* (Raytheon Manufacturing Co.) and *Lacrosse* (Martin Co. and Thiokol Chemical Corp.). Breakout is now in the works for *Nike-Zeus* (Western Electric) and *Pershing* (Martin Co.).

In addition to major item breakout, procurement of replenishment repair parts will be sought outside the prime.

Carrying this process one step further, the Army is now working on breakout from breakout—taking away from the new "sub-prime" contractor additional items which have stabilized if potential cost savings warrant it.

Under scrutiny is a direct contract with Douglas Aircraft Corp., originally subcontracted by Western Electric for launching area items of *Nike-Hercules*. Douglas may well find a big chunk of this taken away under "sub-breakout."

• **The process**—Breakout during the various phases of an Army missile program shapes up this way:

1) Development, Test and Pre-Production—Because major engineering at this point requires numerous

changes breakout is generally not desirable. The Army, however, may and frequently does procure directly items which will not substantially affect engineering compatibility with prime-supplied items. These would include nose cones, adaption kits, booster motors and fuzes.

2) First Production Order—Beginning of item stabilization gets breakout into gear. Easy marks for breakout are supports units such as fueling and power equipment and electric and hydraulic cables.

3) Placement of Follow-on First Repeat Order—At this phase the system prime contractor's end product is usually stabilized. System components which no longer require close control for compatibility and which are not part of the prime contractor's end products will be broken out and procured directly. This could include launchers, support equipment and certain missile metal parts. At this point repair parts will be procured directly through competition. It is at this point, too, that the system prime contractor's fee is negotiated downward in relation to the reduction in subcontracting.

4) Additional Repeat Orders—The government now analyzes major assemblies and important elements of the prime's end items to see whether these should be directly procured and furnished to the prime or if the prime should continue procuring them competitively if other sources are available. During this stage the government takes over direct control of engineering changes. Breakout possibilities here are guidance packages, sustainer motors, frames. Additional repeat orders are placed through fixed-price contracts "whenever possible."

• **Background**—In a statement prepared for the House Appropriations Subcommittee, Gen. John B. Medaris, commander of the Army Ordnance Missile Command, describing evolution of the original "system prime contractor" to the present "system prime contractor with breakout", said the concept was years in development.

He reported:

"When originally approached on this breakout concept, the prime contractors refused to accept it, contending that they were production industries and that they would not maintain a staff of engineers for the production of equipment by others. However, three major advances in missile system contracting helped pave the way toward a 'breakout' philosophy acceptable to the Government and the contractors."

First of these advances, said Medaris, came about through competitive negotiation on the *Honest John* reaffirming the Army's interpretation of the patent and proprietary rights and data clauses in missile development contracts. In general, this held that the reproduction rights of any item de veloped under government funds wer property of the government.

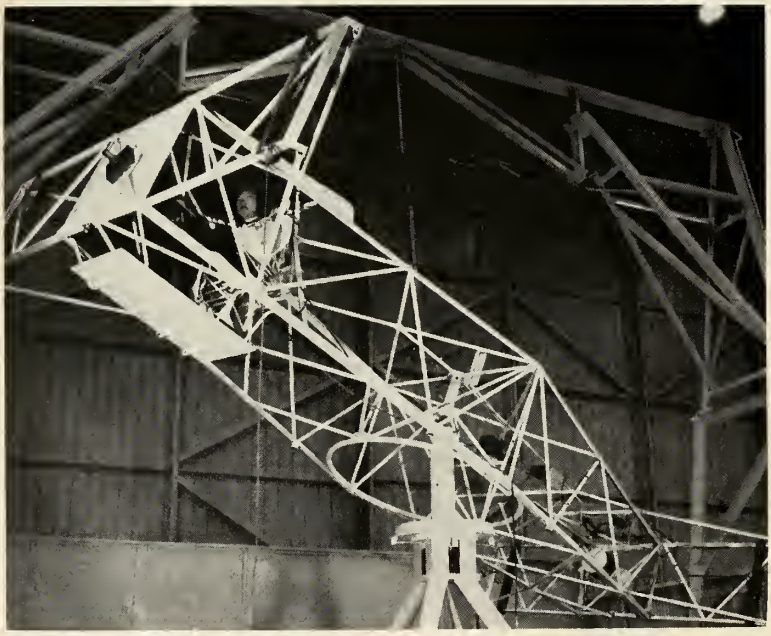
Next step was inclusion in produc tion contracts of a clause requiring th contractor to report to the governmen before production, any proprietar items in the system. "When the impa is major, and reproduction rights ca not be obtained economically, a d velopment program is established whe ever feasible to design the item out the system. Restriction of procureme to a selected few is reduced to a min mum."

Through what he calls "the late major advance" in Army contractir concepts, Medaris pointed out that t systems contractor is charged wi maintaining "system engineering r sponsibility throughout the life of t system no matter how, where or fro whom the parts of the system are pr cured."

Of the total Army missile expend tures, 81% is expended by priva industry.

Rep. Gerald R. Ford (R-Mich.), member of the House Defense Appr priations Subcommittee and a breako booster, says the committee is inte ested in the fact that breakout increas opportunities for small business in t defense picture.

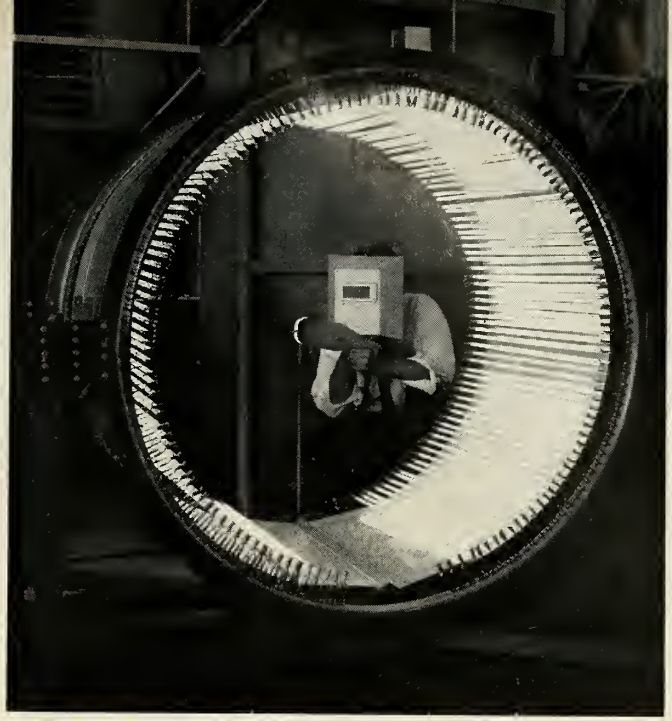
"Anything legitimate that hel smaller companies, is on the rig track," Ford said recently. "The b are getting bigger to the exclusion the small companies who can make great contribution to the defense effo I certainly feel the Army breako system is right."



More emphatically, he told Br Gen. J. E. Engler, Army's Director Procurement-Logistics, at the rece appropriations hearings that if breako was not pushed as far as possib Congress might write it into law:

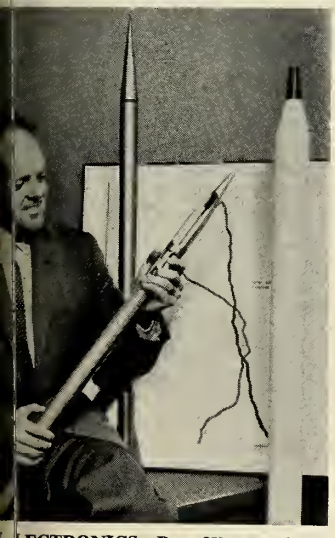
"I think your program is good a is a good illustration of response Congressional interest, but if the pr sure is not kept on it could well that legislative provisions might be i cluded in an appropriation bill otherwise which would take flexibil away from the services . . . arbitra restrictions . . . which would be mu more difficult as far as they (the pri contractors) are concerned, and a gr deal more difficult as far as the Arm the Navy and the Air Force are co cerned.

"It is not impossible to write leg lation which would make their p blems as prime contractors very di cult . . . So let us get them to go alo with you in what you are trying to d



Ford told M/R later Congr would check progress to make s there would be no "dragging of feet."

Space Vehicle Simulator



BOEING SIMULATOR, which rides atop a near-frictionless air-bearing, is being used as a test-bed for trying out various methods of controlling position. Compressed gas gives various attitudes for pitch, roll and yaw.

Industry Does It This Way

STANDARD STEEL Corp. is delivering vacuum-jacked LOX tanks for *Thor*. Holding 13,500 gallons, the 52′ tanks have a high-strength aluminum outer jacket and a stainless steel inner shell.

NOSE CONES: *The Case for Heat Sink*

Designs are limited to relatively low values of the ballistic parameter and require considerable attention to manufacturing tolerances

by Dr. J. D. Stewart

PHILADELPHIA—As nose cones using the ablation system for thermal design have gained more and more prominence in recent days, the question is naturally raised, "Why did General Electric select a heat sink design for the thermal protection of the ballistic missile re-entry nose cone in the first place?"

Before attempting to answer that question, let us consider a few of the characteristics of a ballistic missile. Basically it is composed of two separate systems, the nose cone and the booster system. The nose cone is accelerated by the booster system to a given velocity and altitude in space. At this point, it separates from the booster, follows a ballistic trajectory through space and re-enters the earth's atmosphere. The velocity and angle at which it re-enters are dependent on range and trajectory.

The design of the nose cone depends almost entirely on conditions encountered during the re-entry phase, when it is subjected simultaneously to large decelerations and large thermal loads. The decelerations which result from aerodynamic pressure-drag reach peak values around 50 g's. Depending on the configuration of the nose cone, the peak thermal loads are measured in 1000's of BTU/ft²-sec.

Heat is transferred to the re-entry body by several means. During re-entry, the blunt-nosed body is surrounded by high-temperature air. This air will be partly dissociated and, to a lesser extent, ionized, and it will be at temperatures of the order of 15,000°F at ICBM ranges. This hot gas can transfer heat to the body by convection and by radiation. The former mechanism is the prime contributor of heat, which the body can dissipate by conduction and radiation. For heat sink designs which have low melting temperatures, conduction is the more important.

The heat transferred to the body by convection or friction is approximately equal to the product of the thermal conductivity of the air and the difference between the temperature of the hot gas and the temperature of the wall divided by the boundary layer thickness. The boundary layer near the nose of a blunt body is a few thousandths of an inch thick.

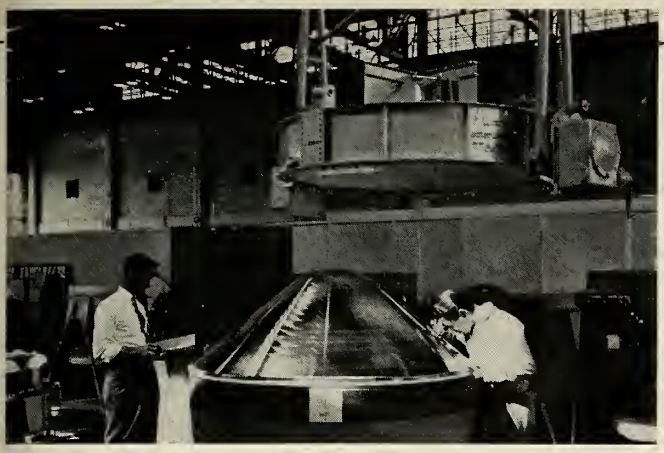
The peak heat flux to a ballistic re-entry vehicle is a function of the ballistic parameter, defined as the ratio of the weight of the vehicle per unit frontal area divided by the aerodynamic drag coefficient. For given re-entry conditions, the lower the ballistic parameter, the lower the peak flux.

The heat flux to the stagnation point of a blunt body is inversely proportional to the square root of the radius. Thus, the smaller the nose radius, the higher the convective flux

• **Requirements**—Transcending other considerations, the primary pose of the ballistic nose cone i provide thermal protection for the load. Since internal components ar stricted to relatively low temperat insulation requirements are of ext importance in selecting nose cone terial.

The nose cone, in spite of its se environment, must maintain struc integrity during re-entry, and strength characteristics of many r rials are seriously reduced at high peratures. Moreover, the design o vehicle must be adequate to withs high deceleration loads as well as sure loads, particularly at high peratures.

By 1955 the ballistic missile gram had reached the stage whe decision was needed on selectio material to protect the payload o *Atlas* re-entry nose cone at I ranges. The Missile and Space Ve Department of the General Ele Company was given this responsi by the Air Force.



• **Sketchy data**—Very little available to aid in choosing mate There was practically no test dat an aerodynamic environment c sponding to that which would be countered by a re-entering bal missile. Some aerodynamic and the dynamic test data had been obtain low supersonic speeds in wind tu and shock tubes, but informatio the blunt shapes required for bal vehicles was lacking.

Furthermore, theoretical cal tions for blunt bodies in hyper flows were in the early develop stage. Lees, of the California Ins

ABOUT DR. J. D. STEWART

Dr. Stewart was awarded a B.A. Sc. in aeronautical engineering in 1949, an M.A. Sc. in 1950, and a Ph.D. in 1952, all from the University of Toronto. In 1952-53, he conducted airframe studies for the National Research Council of Canada. During the next four years, he carried out supersonic airframe structure and missile structure feasibility studies for Convair. He has been with GE's Missile and Space Vehicle Department since 1957, specializing in hypersonic missile structure design.

OVERALL surface finish of GE's copper heat sink cone severely restricts pits and scratches, placing heavy responsibility on quality control.

echnology, had derived for a blunt

ux).

n the field of materials, a consid-
ble amount of information was
ilable on properties of such metallic
terials as copper, aluminum, and
ckel at elevated temperatures. The
rmal, as well as the structural, char-
teristics were known to some degree
function of temperature. There
as some data on more exotic mate-
ials such as graphite and beryllium.
er, little was known about the char-
teristics of plastic materials, partic-
ar under the extremes to which
ey would be subjected during a re-
try trajectory.

Another consideration was the
eight of the re-entry vehicle. Since
is would be limited by booster sys-
m capabilities, an upper limit was
aced on the heat protection system,
miting the insulation requirements.

In addition to the technical consid-
rations of strength and heat protec-
on, there were other factors of equal
portance. Was the selected material
vailable in the quantities required for
oduction? What would be the manu-
turing problems? What about relia-
ility of the heat protection system?
ould local melting be tolerated?

To answer some of these questions, cer-
tain ground rules were specified. The
heat protection system must have high
reliability. No surface melting should
occur. The nose cone must be delivered
on a given schedule.

• **Decisions**—After weighing all factors, GE decided to use a solid heat sink nose cone on the re-entry vehicle. There still remained the question of material. A few of the thermal characteristics of some of the more probable materials are listed in the table below.

Settling on the heat sink for thermal protection meant that the aerodynamic configuration was, of necessity, one with a relatively low ballistic parameter. To provide some thermal margin, use of aluminum, iron, or nickel was not possible because, at ICBM ranges, the surface temperature during re-entry would exceed the melting point of these materials.

Because of the low heat capacity of silver per unit weight, it, too, was eliminated from consideration. The nose cone would have been too heavy.

Beryllium would provide a small thermal margin for the vehicle being considered. However, at the time, it was not available in the quantities required. Beryllium manufacturing problems had not been overcome when the material selection was required.

Tungsten gave an adequate thermal margin but was in short supply and had been placed on the critical materials list. It also had the disadvantage of operating at a surface temperature high enough to put a severe design requirement on insulation needs.

Graphite introduced manufacturing problems. And it also operates at high temperature, creating insulation problems.

Molybdenum suffers severe oxidation at high temperatures. Manufacturing solutions had to be found before it could be used in the nose cone design. Here again, the high surface temperature creates an insulation problem.

The remaining material, copper, met the requirements for no surface melting at ICBM ranges for the configuration being considered. Copper was in plentiful supply and presented no major manufacturing difficulties. Hence it was decided to construct the heat sink nose cone from copper.

• **Smooth design**—The GE 3.1 configuration is basically a blunt, sphere-cone forebody with a relatively low ballistic parameter. The flow over the forebody behind the detached shock wave is subsonic at all flight speeds.

If the boundary layer on the heat sink transits from laminar to turbulent flow, heat flux will be considerably higher. Since very little test data was available on effects of surface finish on transition, it was decided to make the surface of the shield as smooth as possible. In addition, plans were made to flight-test scale models of the GE 3.1 configuration on a research rocket vehicle which would fly at hypersonic velocities. These models were designed with surface finishes of the order of 2 microinches. Controlled roughness patches were placed on the models, and both the smooth and rough surfaces were instrumented with thermocouples, from which heat fluxes could be determined.

The copper heat sink was plated with a thin film of nickel, used to reduce the heat absorbed by the body from the radiating hot gas which surrounded the nose cones.

The overall surface finish of the copper heat sink severely restricts the number of pits and scratches permitted on the surfaces. These requirements on the surface finish of the nose cone placed a heavy responsibility on the quality control for the heat shield.

Thermal Properties of Ablative Materials

MATERIAL	MELTING POINT °R	DENSITY lb/ft³	SPECIFIC HEAT BTU/lb°R	THERMAL CONDUCTIVITY BTU/ft-sec-°R	THERMAL DIFFUSIVITY ft²/sec
Aluminum	1680	169	0.215	0.0366	0.00101
Beryllium	2800	114	0.52	0.0255	0.00043
Copper	2440	559	0.092	0.0632	0.00123
Graphite	6790	137	0.39	0.0051	0.000095
Iron	3260	492	0.11	0.0121	0.000224
Molybdenum	5220	637	0.061	0.0235	0.00060
Nickel	3110	556	0.105	0.0148	0.00025
Silver	2210	655	0.056	0.0672	0.00183
Tungsten	6630	1206	0.032	0.0323	0.00084

It can be seen that the use of the heat sink design for long-range ballistic missiles is limited to relatively low values of the ballistic parameter and requires considerable attention to manufacturing tolerances.

• **Testing**—To verify the theoretical design techniques developed during the design phase of the nose cone, an extensive flight test program was prepared for the full-scale vehicle.

The nose cone and afterbody of the re-entry vehicle were extensively instrumented with pressure and temperature sensors. The measured pressure data would be used to verify data obtained in such ground-based test facilities as the Jet Propulsion Laboratory supersonic wind tunnel and the AEDC "hot-shot" hypersonic tunnel. The pressures would also be used to check out a theoretical, real-gas, blunt body, flow field solution which was developed by MSVD personnel.

The thermocouples are located a few thousandths of an inch below the surface of the heat shield. The measured temperature rises at various stations on the nose cone are used to calculate the fluxes to the surface of the vehicle at various times during the re-entry trajectory.

Accelerometers and vibration sensors are among the other measuring devices which are used during each flight.

To determine the effect of surface finish on the heat fluxes to the body, controlled roughness patches were installed along one meridian line of temperature sensors. These patches had roughnesses of 62 and 100 microinches. The former roughness is characteristic of a good machine finish, whereas the latter is representative of the roughness which would be caused by micrometeorites impacting on the surface. If these roughness patches did not result in transition, the nose cone manufacturing problem would be eased considerably.

• **Getting data**—Three methods of getting the measured flight test data back to the engineer are used. The first and primary source of data return is by direct telemetry to nearby receiving stations. This method has one severe drawback: during a portion of the hypersonic re-entry trajectory, the ionized sheath of hot gases which surrounds the body attenuates the transmitted signal, resulting in "blackout."

In order to obtain data during this "blacked-out" portion of the trajectory, the measured data is stored on a tape. When direct telemetry is again possible, this playback data is transmitted to the receiving antenna. This will, naturally, result in a loss of recorded data during playback, but this is not serious since the major portion of the heat pulse has been completed.

The final method of obtaining data is to record the measured data on tape later stored in a data capsule. During the late stages of the re-entry trajectory, the data capsule is ejected from the nose cone. A recovery system has been developed by MSVD engineers for locating the data capsule in the ocean. No allowance has been made for attempting the recovery of the heat sink nose cone itself.

• **High success**—The copper heat sink re-entry vehicle has been successfully flight tested over a wide range of re-entry conditions. Direct telemetry and playback telemetry data have been obtained on all successful firings to date. The data capsule has survived water impact and has been recovered intact from a large number of flights.

Because a heat sink nose cone is used, the measured temperature data received on all the flights is excellent for comparison with the various theories used in thermal design. To date, a large amount of extremely useful data has been obtained. Stagnation point, laminar, turbulent, and separated flow heating rates have been measured.

The temperature rise at the stagnation point of the copper heat sink has agreed to within less than 5% [illegible] predicted temperature rise. The [illegible] over the forebody has remained [illegible] nar for longer periods of time [illegible] were originally estimated. Afte[illegible] heating rates are lower than pre[illegible] The copper heat sink design ha[illegible] vided the necessary thermal prot[illegible] for internal systems. Cell Produces Power Directly from Gas

SCHENECTADY, N.Y.—A practical "fuel cell" that generates electricity directly from hydrogen and oxygen in the air has been developed by the General Electric Research Laboratory.

Such a device, under study by scientists for more than a century, promises much more efficient power generation than by conventional methods. Thermal efficiencies of over 60% have been obtained which compare with approximately 40% from present steam turbines. The device operates at room temperature and normal atmospheric pressure.

The cell uses an ion exchange membrane as an electrolyte. Hydrog[illegible] oxygen are introduced on o[illegible] sides of this membrane which [illegible] electrode in contact with each s[illegible]

At one electrode, the hy[illegible] molecules divide into electro[illegible] positive ions. NOSE CONES: *The Case for Ablation*

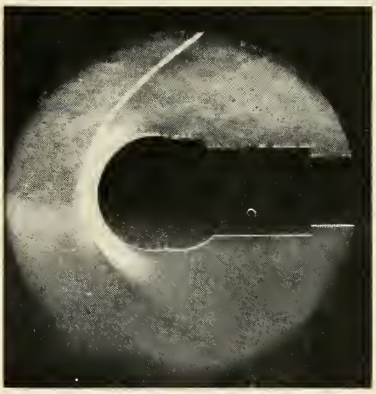
GE engineers report that proper ablating materials have been found and re-entry tests prove the system enhances protection

by Henry G. Lew, Sinclaire M. Scala and George W. Sutton

PHILADELPHIA—The design of ballis missiles and re-entry satellite cap- us for hypersonic flight requires the co ideration of heat protection against th high-temperature environment en- co ntered by these vehicles during re- en y into the earth's atmosphere.

For ballistic missiles, typical speeds of 4 times the velocity of sound lead to quilibrium gaseous temperatures in he order of 13,000°F in the shock ay . The heat transfer rate to ballis- ic missiles is therefore very large, with pe values of about 2000 BTU/ft²-sec ec at the stagnation region. For re- en satellite vehicles, the heat rate is nu lower (peak values of 70 to 100 BTU/ft²-sec), but the time of exposure up ards to 300 seconds) leads to a ar total heat pulse.



The use of heat sinks, which ab- or the aerodynamic heating by tem- er ure rise, has a limitation imposed by e thermal conductivity of the heat in material. For the larger peak heat flu associated with ballistic missiles, he heat cannot be conducted away ro the exposed face of the heat sink to the interior rapidly enough, and at trophic melting occurs. This is xa ly what happens to metallic ete rs, since metallic meteorites gen- ra exhibit large cavities after entry to the atmosphere.

Calculations indicate that the recov- red fragments represent only a frac- on of their original size. Stony iet rs generally fare somewhat bet- ir uring re-entry, since part of the ol n stone absorbs heat by vaporiz- ng. This process of melting during re- atr is called ablation, and is actually a type of self-regulating mass transfer process.

• **Plastics researched**—Stone, of course, is not an acceptable structural material, and hence a search was initiated to find suitable ablation materials for hypersonic re-entry. The discovery of appropriate materials actually started from tests on rocket motor materials. In the course of searching for better nozzle and jet vane materials for the *Hermes* Project, (1950-1954), plastics reinforced with glass fibers were investigated. Although these materials eroded badly in these initial tests, they did not erode completely. This was surprising because this type of plastic was generally used for service below 500°F.

Since one may regard these materials as being part ceramic and part plastic, at first it was felt that this was simply a convenient method of fabricating inorganic oxides into a structure which is not susceptible to thermal shock. This ability to withstand thermal shock stems both from the high strength of glass fibers—up to 500,000 psi—and from the certain amount of flexibility that the fibrous construction gives to the structure. After considerable development, glass-reinforced plastics were perfected to the point where they became suitable for use as rocket motor parts exposed to environmental temperatures up to 5000°F.

• **Nose cones**—The arrival of the ballistic nose cone program and its attendant high temperature environmental problems brought the problem of thermal protection into focus again. It was not obvious immediately that the type of material used in rocket motors would be suitable also for hypersonic re-entry, where environmental temperatures are of the order of

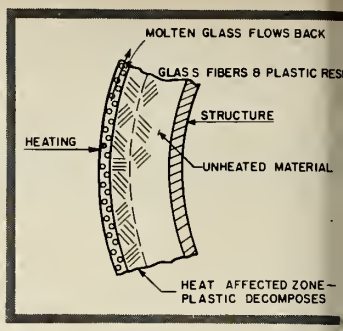
HOT GAS gap generated at high speeds created with 2500 kw AC air-stabilized free jet, proved out models.

ABLATED QUARTZ model. Up to 100% pure silica has been tested successfully, but shielding value drops in re-entry.

13,000°F, and the air is highly oxidizing. (Generally, rocket engine flames are reducing).

The possibility existed that the resin would burn exothermically with air, and the reinforced plastic would fail catastrophically. Therefore, research programs leading to the development of ablation materials for hypersonic flight were initiated by the Aerosciences Laboratory of the Missile and Space Vehicle Department of the General Electric Company, under contract with the Ballistic Missile Division of the Air Force and by the Army Ballistic Missile Agency, which was developing the *Jupiter* missile.

The Air Force required a method of obtaining flight data from nose cones. This called for the use of a data capsule which could be ejected from the nose cone at high speed, survive re-entry, and then impact the water at 400 ft./sec. and still remain functioning. On the basis of strength and weight requirements, it appeared imperative to use reinforced plastics as the outside material. To determine the hypersonic ablation characteristics of the reinforced plastic, models were tested in a rocket motor exhaust jet which simulated flight velocities up to 13,000 ft/sec. and yielded stagnation temperatures of approximately 5400°F, stagnation pressures between 200 and 300 psi, and heat transfer rates of 800 to 1800 BTU/ft²-sec.



• **Reinforced plastics**—Using this facility, the discovery was made that "E" fiberglass reinforced plastics could absorb up to 2000 BTU for each pound of material which ablated. As the plastic ablated, the resin pyrolized into a carbonaceous structure and a gas flowed into the gaseous boundary layer, while the glass melted and flowed back along the surface.

The low thermal conductivity of this plastic kept the heat-damaged region close to the surface. If the aerodynamic skin friction and pressure gradient were sufficiently low, the glass usually vaporized, leaving a carbon surface.

A second discovery was made at this point: if the "E" glass, which is a low melting point glass, is replaced by the H. I. Thompson Co.'s Refrasil (96% silica), the plastic then absorbed 6000 BTU for each pound ablated in rocket exhaust tests.

This is 40 times better than a copper heat sink, on a weight basis. This property is due to the higher viscosity of molten silica, which allows it to partially vaporize before the melt flows downstream.

On the basis of these experiments, GE's data capsule was placed in production in the summer of 1957, and

REINFORCED plastic protects struct

was the first production vehicle to made from an ablating material thermal protection during hypersc re-entry.

The Army Ballistic Missile Age also stimulated by early experim on rocket motor parts, started sim research for *Jupiter* nose cones. In t program, hundreds of ablation terials were tested in rocket engine hausts at the Redstone Arsenal. results of the two programs were s lar and an ablating nose cone demonstrated and recovered on IRBM trajectory by a *Jupiter 'C* October, 1957.

• **Plasma jet development**—though the rocket exhaust was us the temperature simulation was lim to IRBM re-entry conditions. Th fore a more severe environmental which would simulate ICBM co tions was needed with temperature the order of 13,000°F. A water st ized plasma arc, on which ori work was conducted in Germany Maecker in 1951 and Weiss in 1 was selected for test and evaluatio

Constructed by the Chicago way Laboratories under GE sub tract, the water stabilized arc bec test operational late in 1956. facility produces a flow of dissoc steam at a temperature of app mately 23,000°F at subsonic flow cities, resulting in heat fluxes of order of 400 to 3000 BTU/ft²-sec

Using the water stabilized arc important discovery was made tha organic "E" glass fibers could b placed with nylon, with an increa performance to about 10,000 BTU in this test facility. This was expl in part by the evolution of a molecular weight gas as the r pyrolized. This gas thickened boundary layer and absorbed en considerably reducing the heat flu the surface.

Although the stagnation entl of the water stabilized arc was p for re-entry studies, its chemica vironment did not simulate flight ditions. This led to the developme

ABOUT THE AUTHORS

Dr. Henry G. Lew, *Manager, Gas Dynamics, has been associated with GE's Aerosciences Laboratory since 1957. Previously he was Professor of Aeronautical Engineering at the Pennsylvania State University. He received his Ph.D. from the Polytechnic Institute of Brooklyn. His fields of interest and publications have been in the boundary layer and heat transfer theories, with emphasis on control and mass transfer and plate and shell theory. His recent interest has been in the two phase boundary layer problem.*

Dr. Sinclaire M. Scala, *Consulting Research Engineer, High Altitude Gas Dynamics, has been associated with the Aerosciences Laboratory since 1956. He had previously been employed at New York University Westinghouse Electric Corporation and Princeton University where he received his Ph.D. His special field of interest is hypersonic aerodynamics, and he has published many technical articles dealing with mass transfer in chemically reacting hypersonic boundary layers and ablation, as well as other aspects of hypersonic molecular interaction problems.*

Dr. George W. Sutton, *Consultant Research Engineer, Energy Transfer, joined the Aerosciences Laboratory in 1956. He received his Ph.D. at the California Institute of Technology and had been with the Lockheed Missiles Systems Division Research Laboratory prior to joining the General Electric Company.*

His main field of interest for the past three years has been in the analysis of the response of ablation materials to aerodynamic heating and he has published several papers on heat sink analysis, melting ablation, mass transfer cooling with combustible gases, and the ablation of reinforced plastics.

small gas stabilized plasma arc, which ally culminated in the development the large 2500 kw AC air stabilized e jet. The latter facility was avail- le for testing in 1958. About 2500 was added to an air stream and nperatures of the order of 12,000°F re obtained. Using the air arc, it s discovered that the combustion of plastic would degrade its ablation rformance only slightly, but catas- phic burning would not occur.

• **Ablation theories**—Since experi- nts are best complemented by the- y, it was clear at the outset that re than an order of magnitude type analysis would be required if the gineering designer was to have con- ence in this radically new type of tem for the thermal protection of entry vehicles.

This was particularly true when it s understood that the conditions en- ountered during hypersonic re-entry, nely stagnation enthalpy levels of order of 13,000 BTU/lb., tempera- es of approximately 13,000°R and ssures up to 100 atmospheres, could be successfully simulated on the und for times of the order of one ute (ca 1956). Theories were there- e required which would predict the ormance of ablation materials over ide range of hypersonic flight con- ions.

It is clear that the theoretical de- ination of the rate of ablation of skin of hypersonic re-entry vehicles res an understanding of the mole- r interactions between a surface its environment. As is usual in sics, such problems are described y system of conservation laws, and ist of the conservation of mass, the ervation of momentum and the ervation of energy.

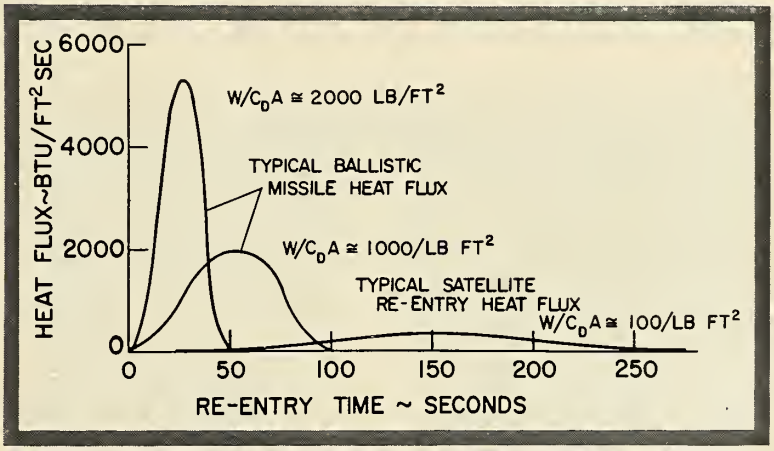
n addition, chemistry is involved, the thermal degradation of a ma- l may involve pyrolysis, depoly- zation, melting, vaporization, and bustion, all resulting in interphase transfer.

n comparison with the voluminous ture dealing with design for ordin- convective heat transfer, knowledge e beginning of this program was er regarding the art of design of aterial which degrades thermally yet does not fail as a structural d.

hus, it was clear that the theore- analysis of the complex ablation em required a sophisticated effort. act, the first rigorous theoretical on to the problem of determining ate of ablation of a ballistic nose required the use of high speed onic computers, including the 704 and the Reeves REAC.

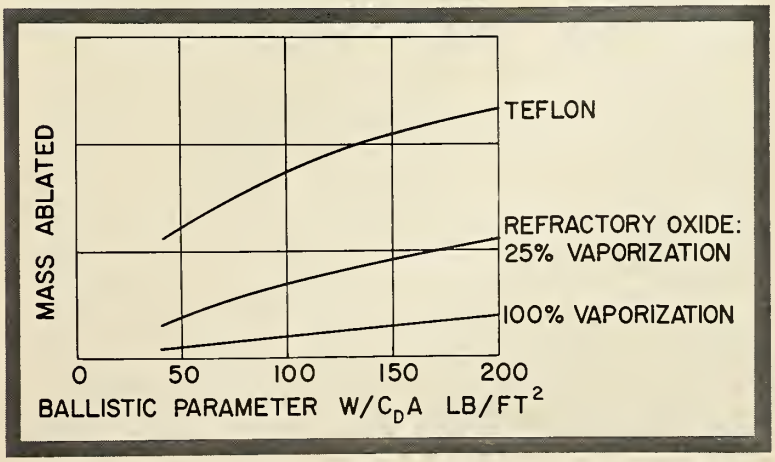
his solution was presented in the er of 1957 at the Mass Transfer Cooling for Hypersonic Flight Conference sponsored by the Air Force Office of Scientific Research and the Rand Corporation. The solution showed that the heat blocking and heat absorption of a reinforced plastic could be of the order of thousands of BTU/lb. It has also been calculated that the magnitude of the "effective heat of ablation" of a material is not a constant, but depends critically on the environmental conditions to which the material is exposed.

The theory indicated quantitatively the magnitude of the separate contributions of the following to the heat of ablation:



a) the heat blocking due to mass transfer (as a consequence of the thickening of the boundary layer),
b) the heat absorbed or released due to phase changes and combustion during the gasification of the solid,
c) the heat blocked by convection in the liquid phase.

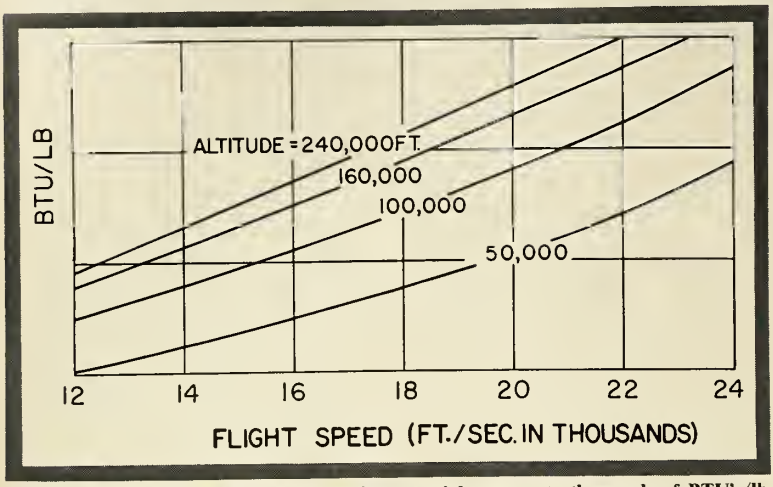
The dependence of the blocking term (a) on enthalpy has been experimentally verified in water arc plasma jets, rocket motor exhaust jets, and air arc plasma jets and tunnels. It was found that tests conducted in rocket motor exhausts, which have a considerably lower enthalpy than high energy plasma jets, in general will result in an underestimate of the potential of an all plastic ablating material.



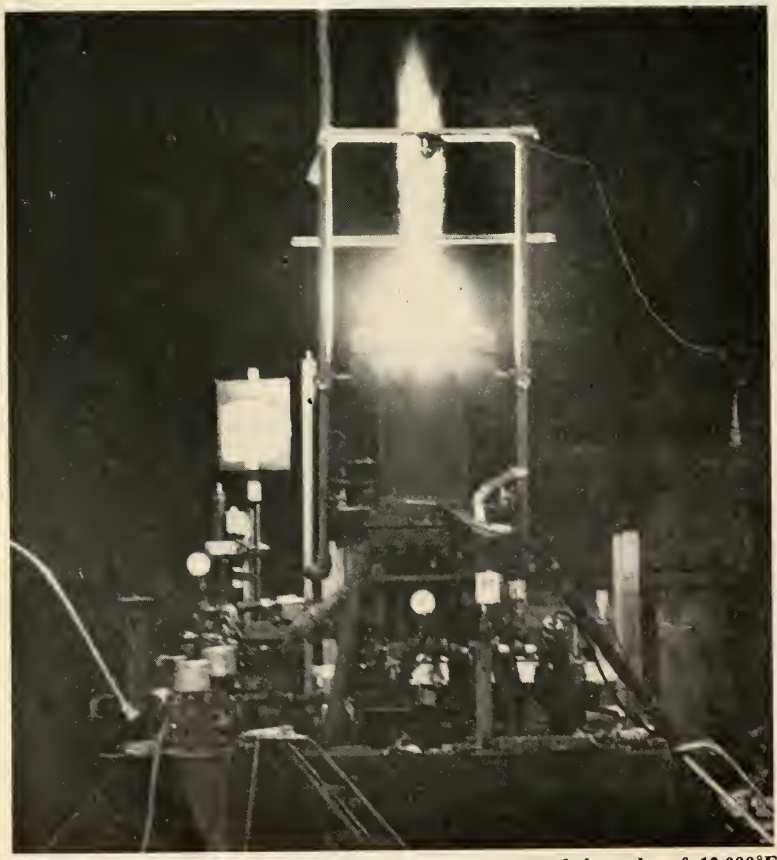
• **Ablation theories**—Since experi- ablating materials fall into the follow- ing categories:

1. Pure plastics
2. Plastics, reinforced with organic or inorganic fibers
3. Silica or other oxides
4. Carbon or graphite

Ablation theories have been developed for each of these classes, although the main line of development was directed toward reinforced plastics. When the reinforcement is "E" glass fiber, the percentage of glass is usually taken as that which gives the highest strength. The same is true when the reinforcement is nylon. When refrasil



HEATING GRAPH shows typical ballistic missile and satellite re-entry heat fluxes.



TOTAL MASS which is ablated at the stagnation point of the re-entry satellite.

or fused silica fibers are used, successful tests have been obtained with as little as 10% silica, and as much as 100% silica. Of course, the latter type of material with 100% silica is really not a reinforced plastic.

For pure fused silica, a theoretical prediction which has been verified experimentally: i. e., that liquid layers, which flow downstream under the influence of pressure gradients and aerodynamic skin friction tend to not vaporize as the environmental pressure rises.

EFFECTIVE HEAT absorption of ablating material runs up to thousands of BTU's/lb.

STABILIZED 2500 kw AC air arc obtaining temperatures of the order of 12,000°F was developed to provide chemical environment simulating flight conditions.

Thus, the peak stagnation pressur encountered during hypersonic re-ent retard the gasification of the materi minimizing the contributions of he blocking and heat absorption, and r sulting in a reduced "effective heat ablation." During re-entry the stagn tion enthalpy drops and the stagnati pressure rises. Hence one finds that t effectiveness of fused silica as a therm shield decreases all along the re-ent path.

The ability of plastics to ablate a satisfactory manner has focused tention on thermo-plastics which, wh heated, depolymerize to the monom The monomer usually has sufficien high vapor pressure so that it vapo izes immediately, giving the requir mass transfer into the boundary lay A polymer typical of this class Teflon.

These thermo-plastics are dist guished from the resins of reinforc plastics in that no carbon char is l

Another class of ablating materi is one which combusts only at the s face. This surface combustion usually diffusion controlled, and resu in ablation rates which are less th any of the other usual ablation m terials. Graphite is typical of this cl of materials. Aside from the us problems of fabricating suitable la parts from graphite, common grades graphite have a large thermal cond tivity and hence are not selfinsulat as are other ablation materials.

• **Application to design**—In ap cation to design, the designer n merely divide the aerodynamic h transfer by the effective heat of al tion to determine the amount of m terial erosion. In addition, a heat c duction calculation, allowing for moving boundary, predicts the pe tration of heat within the undama substructure.

It has been shown theoretically t for slow satellite re-entry, additio insulating material usually is requi behind the ablating skin to keep backface temperature within the lir which can be tolerated by the paylo

On the other hand, during the listic re-entry of a nose cone, wh involves much more severe heat tra fer rates than satellite re-entry, the face of the ablating material recede the same rate that the heat penetr into the interior.

These developments and disco ies have been verified by the Air Fo General Electric Company *Thor-A* flights, where several ablating n cones have successfully re-entered earth's atmosphere at hypersonic v cities after a 5000 mile ballistic tra tory. Thus, the task of finding proper types of ablating materials been completed.

'NEAR PERFECT' case on cover looked like this after hydro-static test.

Notch Sensitivity — Barrier to Solid Rockets

Challenge is to increase large motor case strength without cost in weight and reliability

WASHINGTON—Despite all the glamour in storybook and stock market, and despite the exotic nature of their missions and technological challenges, rockets usually work or don't for some pretty grubby reasons. One of the grubbiest is the motor case—the pressure vessel that contains and directs the hot, high-velocity gases of the burning propellant.

In fact, the failure of large motor case know-how to keep up with other states-of-the-art makes this the limiting factor today in solid rocket motor development. And, as a result, the unglamorous manufacturing end of the business has suddenly become the site of one of rocketry's more exciting scientific challenges—one for which a great many millions of dollars have been earmarked and in which a large number of companies and missile projects have a large and important stake.

Take the "desired" performance figures of such projects as *Minuteman, Polaris, Eagle, Pershing, Subroc, Mercury*, etc., for example. Ultimately their range, payload and reliability hang heavily on how fast large motor case technology advances.

The basic challenge is to increase large motor case strength without incurring any more cost in weight or any reduction in reliability. In order, this means finding out why materials that exhibit high strengths in the testing laboratory fail at fractional stresses when fabricated into a motor case; and —having found out why—determining what to do about it.

• **Answer coming?**—Only recently have the first hints of an answer begun to emerge. But even at this early stage, R&D results point to some important do's and don't's for large motor case designers and fabricators. Some appear pretty contradictory at first glance, such as for example this admonition: To get a high-strength case, heat treat to a lower strength than you want. The reason: Notch sensitivity, a peculiarity of high-strength materials that may provide the means of breaking through the solid rocket motor case strength barrier—if we can but understand it well enough.

The problem is one of vital national importance. In the fancier areas of solid rocket technology, like propellant chemistry, interior ballistics, etc., the big challenges have been met and won.

Propellant mixes and burning patterns have been developed which are capable of producing solid rocket motors with specific impulses that nudge the 300 mark; with burning pressures graduating from as low as 100 pounds per square inch up to the thousands of psi of pure detonation; with accelerations as low as one or two g's and as high as you please; with burning times from a fraction of a second to many minutes; and with a tolerance to environmental conditions ranging from the near-0° Kelvin temperatures of interstellar space, to the 1000°F and up of supersonic aerodynamic heating.

• **The trouble:** There are no motor cases capable of reliably putting this know-how into air or space. And no matter how advanced a solid propellant grain may be, it's still just a costly glob of highly dangerous chemicals with a fancy geometry until someone puts a suitable can around it—a can light enough to meet mass ratio requirements, strong enough to produce in volume and at a cost commensurate with national need.

Today's motor case requirements include wall thicknesses down to 0.020" and less, materials strengths in excess of 290,000 psi for steel and 100,000 psi for aluminum, strength at temperatures up to at least 1000°F—all this and reliability too. Briefly it boils down to a high-modulus motor case with a strength-to-weight ratio of at least 1,000,000 inches, compared to the 760,000 we're struggling to obtain now. It is a problem that encompasses

This is the first of a two part series prepared by the technical staff of M/R on the problems of high-strength, thin-wall solid rocket motor cases. Part one covers the newly discovered phenomenon, notch sensitivity. Part two, in the issue of June 22, will deal with biaxial stress, motor case test procedures, manufacturing techniques and some of the new materials.

Hydro-static tests wrecks havoc . . .

materials, manfacturing techniques, test methods and more thorough approaches to stress analysis.

On M/R's cover this week is the best of one state-of-the-art approach to making high-strength, thin-wall solid rocket motor cases. "A gem of the craftsman's art," the project manager said when he first saw it. "The best of the whole program!" On these pages you see how it looked after hydro-static test! The question that has plagued and continues to plague rocketry is: Why?

• **Case history**—The rocket case on the cover was fabricated from machined forged rings of 5%-chrome hot-worked die steel girth-welded together. This is still thought to be a very promising basic approach to high-performance solid rocket motor case manufacture.

Case diameter was 31 inches; length, 11 feet; wall thickness, 0.098 inches. Tolerance on the wall was held to ± 0.002". Ovality and banana were negligible, and the maximum TIR (total indicator reading) was 0.080"! All welds were X-rayed before and after heat treatment. No weld repairs were necessary. The as-machined finish on the case was less than 64 microinches.

Test of both welded and unwelded coupon samples that accompanied the case through heat treatment showed the processed material to have a minimum yield strength of 241,000 psi, a hardness of $R_c = 53$ and an elongation in the transverse and longitudinal directions of 6% and 11% respectively. Numerous pull tests showed an ultimate tensile of 270,000 psi and 100% strength in the weld and heat-effected areas. There was no decarburization. A perfect case—or so it seemed.

Upon delivery to the customer, the case was subjected to 10 "low-pressure" hydrostatic cycles at 500 psi each "to check out strain gaging and instrumentation." Then, during the first of two full pressure static and one dynamic hydro-test, it failed at a pressure of 875 psi. Its design minimum was 1175 psi, or a hoop stress in the wall of 210,000 psi. Again the question: Why did it burst at such a low stress when every pre-test check indicated a minimum yield of 240,000 psi and a burst of 270,000 psi? And why, when it did fail, did it shatter as though it had been heat treated into the blue-brittle $R_c = 74$ range?

The answer to question number one is: Notch sensitivity. The answer to the second question is a recently appreciated peculiarity of the kind of biaxial loading you get in a cylindrical pressure vessel.

This case history is typical of the kind of frustration rocket motor case makers have run into ever since first efforts were made to achieve a steel case with a minimum yield strength in excess of 180,000 psi.

You get an idea of how important this problem is when you realize that Aerojet-General is buying *Polaris* motor cases from no fewer than seven different suppliers, in addition to its own in-house development work; and that Navy's Special Projects Branch and Aerojet together are conducting 30 different *Polaris* case development programs. Most are aimed basically at overcoming notch sensitivity in high-strength motor cases.

• **Notch sensitivity**—Like many other principles now beginning to be applied to rocket motor case manufacture, notch sensitivity has been known in laboratory research work in one form or another for many years. Rarely, however, has it been necessary to apply it to large pieces of production hardware. Now, all preliminary indications are that it *must* be taken into account in designing any motor case with a minimum yield strength-to-weight ratio in excess of 730,000 inches.

Technically, notch sensitivity is the ratio of the notch strength of a material to its smooth (unnotched) strength. Notch sensitivity increases as the ratio decreases. For all practical purposes the maximum value the ratio achieves is 1.05, where the notched specimen is stronger than one that is flawless. The ratio may get as low as 0.20. What this all means is that a flaw—even one too small to be detected by any currently available means—may radically change the strength characteristics of any given material.

Flaws, or notches, include: cracks in the material, inclusions (as in a weldment), occlusions, local brittle spots—any discontinuity in the structure of the material.

Essentially, these small flaws act as stress raisers, causing local increases in stress equal to many times the calculated case stress. Under these circumstances the flaw propagates as a fast-growing crack—usually with catastrophic results. This is the same thing that caused Britain's Comet jetliners to blow up a few years back, and, apparently this is what happened to the case on M/R's cover—though the company doing the hydrotest was taking movies at 24 frames a second (compared to 1000 frames used by most rocket motor companies) whi made it impossible to determine t initial failure and its subsequent pro gation.

• **Notch ductility**—The opposite notch sensitivity is notch ductility. T is a measure of the ability of a n terial to permit local plastic deforn tion to relieve high notch-induc stresses. This means that small volun of the parent material actually mc in such a direction as to relieve t stress without increasing the size the flaw—and thus starting a r crack.

Notch sensitivity—its causes a characteristics—is the object of a la amount of research and testing by st interested agencies as Naval Resea Center, Naval Gun Factory, Spec Projects Branch, Bureau of Ordnan ARDC, Redstone Arsenal, NASA, Materials being tested run the ga ut—X-200, 4130, 4340, 12 Mo S.S. 410, S.S. 301, S.S. 304, 64 AM-350, Vascojet 1000, etc.

Virtually all show that at the h strengths demanded today—220,0 to-240,000 minimum-yield—nearly materials tested show a high no sensitivity when heat-treated to th optimum unnotched tensile streng Results also indicate that a hig notch strength can be assured by h treating to a somewhat lower notched strength level. See the cur accompanying this article for U Steel's air-quenched missile boo material, X-200, and for the 5 chrome hot-worked die steel, Vasco 1000.

These figures don't mean that h strength cases can't and won't be m —every now and then. Indeed t have. What it does mean is that conventional fabrication methods, th can be no guarantee of repeatib on the assembly line—or of reliab in flight—not until materials can delivered and fabricated in a gua teed flawless condition; until inspec methods can be developed to spot such flaws (once spotted they can repaired); or until materials and fa cation methods are developed that not subject to notch sensitivity. three approaches are currently u exploration.

• **Random failures**—Notch s tive materials give the highest stren ever achieved—if there is no nc But if one case goes to 270,000 the next one may fail at 145,000; next at 230,000; others at 170, 255,000, 200,000, 150,000, 260, etc., even though materials and cessing may be identical in each All failures are random. There is pattern from which to predict fu performance, and thus no reliabilit the finished product.

This is why you read about claims burst strengths up to 300,000 psi on one hand, but on the other, you've to read about repeatable flight rdware in excess of 200,000 psi.

Some of the characteristics of notch sitivity discovered to date are sur-sing. For example, it bears no ob-us relationship to:

• **Elongation**—Notch sensitivity, nerally speaking, is independent of per cent of elongation—except in very low percentage range (just a v percent), where most materials are y notch sensitive.

• **Yield-tensile strength ratio**—This the ratio of min-yield strength to imate tensile strength. With some ket motor case alloys it is a high ure; with others, quite low. This ead between first plastic deforma-n and failure seems to bear no con-ent relationship to notch sensitivity. a material is notch ductile, it will eve stress concentrations. If it isn't, von't.

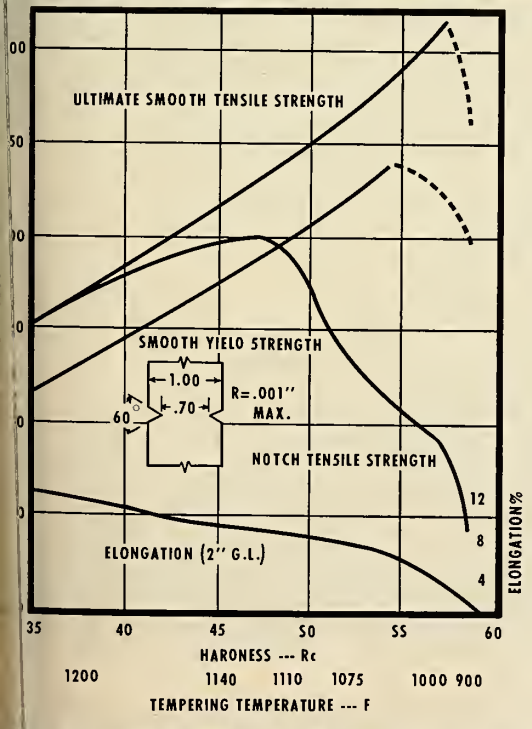
Those physical properties which ear to affect notch sensitivity in-de:

• **Ductility**—The greater the ductility, the less the notch sensitivity, but also, unfortunately, the lower the material's minimum yield strength.

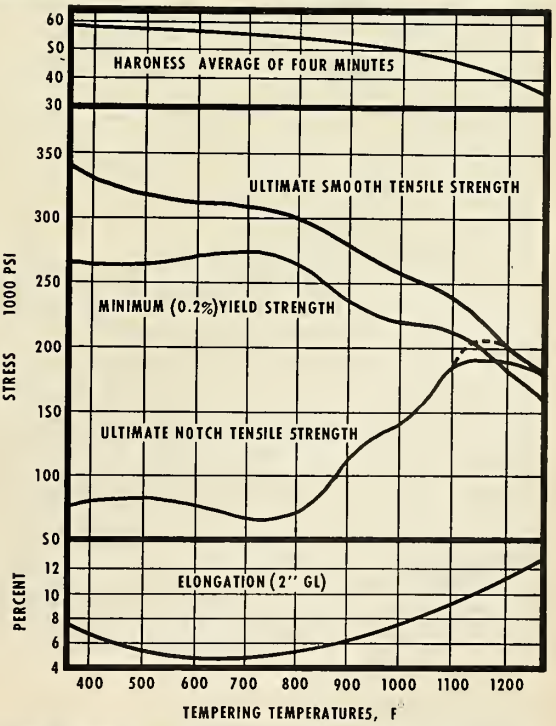
• **Decarburization**—Convention frowns on decarburization during heat treatment, since it usually defeats the purpose of the alloying effort. Recent work, however, shows that for high-strength motor cases a modicum of decarburization (to a depth not exceeding four per cent of wall thickness) reduces notch sensitivity—particularly to surface flaws.

• **Grain direction**—Often, but not always, notch sensitivity is worse in the transverse grain direction.

• **Temperature**—Generally, the higher the environmental temperature the lower the notch sensitivity. Thus, some of the reported 240,000 psi min-yield motor cases have been hydro-tested at a temperature of over 300°F. At this temperature the material is notch ductile, whereas at room temperature it is notch sensitive.



• **Wall thickness**—Very thin sheets (wall thickness below 0.010") show a much lower notch sensitivity than thicker sheets of the same material. Why? No one knows. It is only an empirical conclusion, as a result of tests.

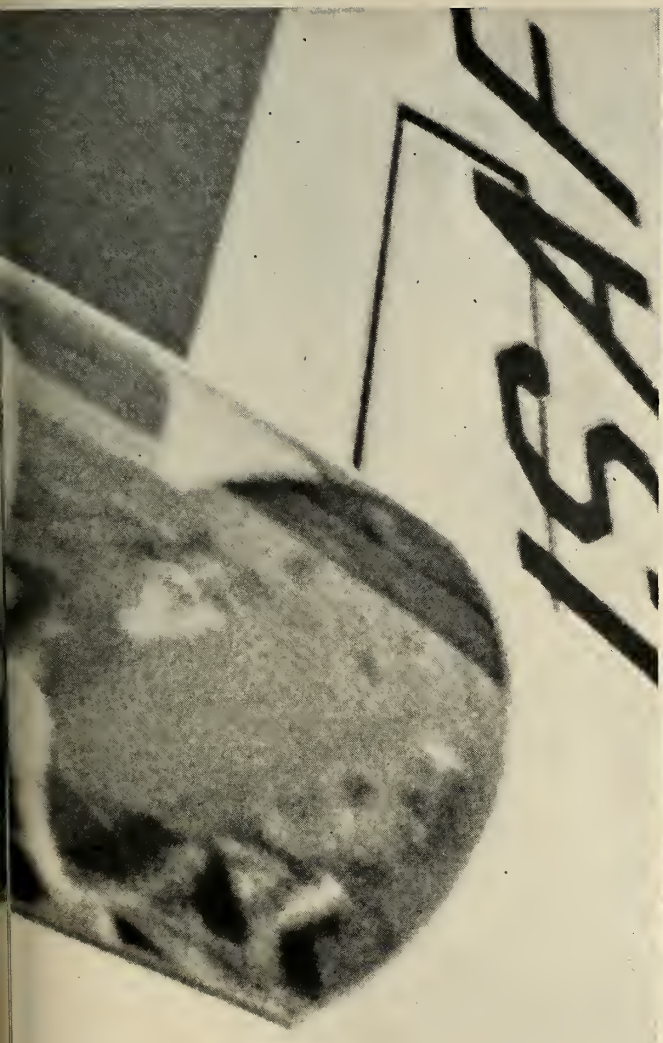


• **Alloy concentrations**—Notch sensitivity is usually less with alloys that have a lower carbon concentration (0.35-to-0.45% C), such as SAE 4340 types of steels.

All of this technical talk may sound like so much who-struck-John, but it is deadly serious business—one that has cost the American tax-payer literally hundreds of millions of dollars. It can't help but be a major factor in the *Polaris*' and *Minuteman* programs.

• **Size**—Higher strengths have been repeatedly achieved in small-scale model motor cases, say, six inches in diameter. However, results in these small test cases do not scale up to the larger size with any usable degree of reliability.

This is a highly competitive market and the company that first cracks the "notch barrier" effectively, repetitively and reliably and achieves a 1,000,000-inch strength-to-weight ratio in a high modulus (metal—and almost certainly steel) motor case stands to profit much thereby—to say nothing of what it will mean to the country's missile and space flight programs.



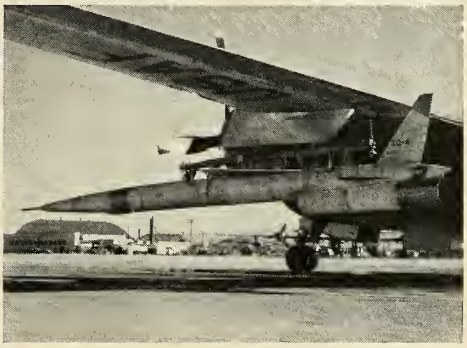
RO LEMS of notch sensitivity in large solid rocket motor ase were largely unsuspected until a few months ago. Left is -2(0.063 sheet (1750°F, quarter hour (Argon), oil tempera-ure, hour air) at room temperature tests. Right is Vascojet 1000 .063 sheet (850°F (Argon), ½ hour; air triple temper, 3 hour total) at room temperature tests. (Graphs courtesy Lewis Lab, NASA.)

AIRBORNE! FIRST LOW-COST SPACE AGE AIRCR

USAF-NORTHROP T-38 TALON ANSWERS AIR TRAINING COMMAND NEED FOR A SAFE, ECONOMICAL TRAINER FOR SPACE AGE AIRMEN

missiles and rockets, June 8,

NORTHROP'S T-38 achieves successful initial flight test at Edwards Air Force Base – offers USAF space age airmen supersonic training with twin-jet safety.



NORTRONICS

For U.S. Army's Hawk, Nortronics designs, produces airframe and all mechanical ground support as major subcontractor to Raytheon Co.

RADIOPLANE

Latest Radioplane answer to U.S. Armed Forces' drone needs is the supersonic, sophisticated USAF XQ-4 type target drone.

INTERNATIONAL

Northrop's N-156F multi-purpose fighter, a high-performance weapon system at minimum cost, now being developed under USAF contract.

NORAIR

The T-38 pioneers a new Northrop family of lightweight, low-cost manned aircraft. It is a breakthrough reflecting Northrop's constant use of all the tools of scientific management in finding lower-cost solutions to the problems of present and future defense. Latest tool: the Norair-ead Performance And Cost Evaluation Program called PACE.

NORTHROP CORPORATION

Beverly Hills, California

Pioneering Monkeys and Mice

Two monkeys came back strong from *Jupiter* flight, though one dies later; *Discoverer III* tests will be US' most elaborate effort

by James Baar

WASHINGTON—This year may be remembered as the year of the space animals. The U.S. Army entry: Rhesus Monkey Able and Spider Monkey Baker. The U.S. Air Force entry: Four black mice.

Other future entries: A variety of animals including larger primates.

The Army's monkeys lodged in the nose cone of a Chrysler *Jupiter* scored ahead of the Air Force when bad weather and technical difficulties delayed launching of *Discoverer III*.

Able died four days later when Army surgeons attempted to remove an electrode placed in her body before the historic launching. However, Army officials said death was caused by convulsive heart movement during the operation and was not a result of the space flight.

Until Able and Baker soared down the Atlantic Missile Range May 28, Russia held most of the records in the space animal derby.

Russia's *Sputnik II* carried the dog, Laika, into a 140-1038 mile orbit Nov. 3, 1957. Laika survived more than a week.

The Russians also have announced successful recovery of two small dogs after they traveled 281 miles straight up in a rocket.

The Army last December sent a monkey named Old Reliable down the Atlantic Missile Range in a *Jupiter*. He never was recovered, but telemetered data showed that he survived re-entry.

The *Discoverer III* satellite—the most advanced U.S. biomedical space experiment to date—was originally scheduled for May 21 at the Pacific Missile Test Range. The shot was postponed because of bad weather. Technical difficulties forced postponement again May 23 and again May 25.

The Air Force provided the same type missile for *Discoverer III* as it had for the first two *Discoverers:* A Douglas *Thor* topped with a Lockheed-Bell second stage.

Other key *Discoverer III* statistics —all similar to *Discoverer II:*

- A 1600-pound second stage that goes into orbit.
- A 440-pound payload including a 195-pound re-entry vehicle.
- Equipment designed to stabilize and adjust the attitude of the satellite in orbit.
- A recovery system designed to eject the re-entry vehicle at a determined point so that C-119's cc be waiting to snag it after it re-ente the atmosphere.

But the all-important difference the presence of the four mice. T recovery would mean the first succ ful return of an animal after it orb the earth.

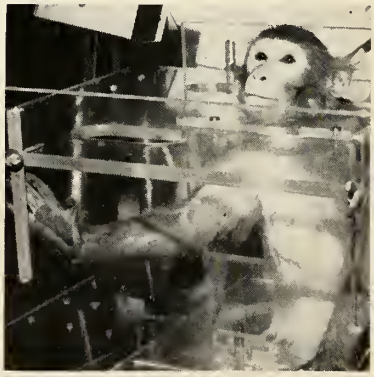
The mice were placed in a Gen Electric life capsule equipped with conditioning and food.

The pop bottle-size air conditic was designed to keep the tempera at about 75 and eliminate muggir The food—a mixture of orange ju oatmeal and gelatin—fits into a cer feeding station. Instruments mor the mice's reactions.

Results from the Able-Baker lau ing are still being analyzed—part larly the effects on the flight on n spores, sea urchin eggs, human bl onion tissue, seeds and fruit fly pu that were carried in the *Jupiter* cone.

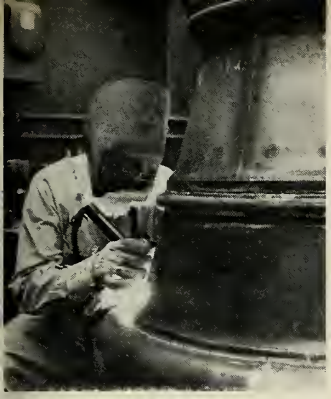
The sea urchin egg experiment cluded fertilized eggs, unfertilized and eggs that were fertilized during 1700-mile flight. Scientists sought check the reaction of both weight ness and cosmic rays on fertiliza

Scientists have expressed cor erable doubt that some species customed to a 1 g environment carry out their life cycles in a diffe one.



First results showed that se pound Able and one-pound Baker perienced no "undue alterations" their basal physiology.

This was particularly encoura since the two monkeys experience to 15 g's during takeoff and 38 for less than a second during re-e The most that the first man in spa expected to experience is 12.



Army and Navy scientists stre the risk in extrapolating data animals to men. But the indica were that men would be able to d well as monkeys.

THIS MOUSE was one of a group of 60 candidates for *Discoverer III* ride.

MONKEY ABLE, who survived space flight but died later in operation.

HELIARC welding the exterior of a double-walled thrust chamber for Rocketdyne's *Redstone* engine.

Welding *Redstone*

Extreme care exercised at Reynolds plant precludes faulty welds

SHEFFIELD, ALA.—Weld strength played an important part in the reliability—about 99%—of the y's *Redstone*.

More than 1000 feet of welds go the construction of the aluminum g used for the *Jupiter-C* rocket the *Redstone* ballistic missile. The gs are fabricated at the Reynolds ls Company missile plant at ield, Alabama. Performance rec- show that because of precision ing, constant research, and in- ve inspection, no *Redstone* or *er-C* has failed due to faulty welds.

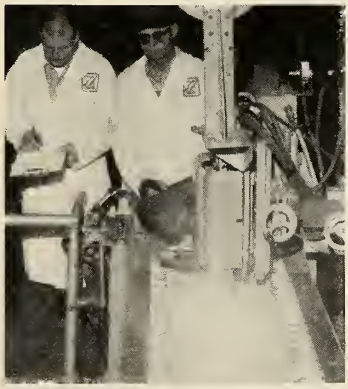
luminum outer wall of the 75,000 hrust *Redstone* engine's heat ex- ger is manually Heliarc welded t, an HW-9 torch. The finishing el, on the engine's critical thrust a ber are also made manually with Heliarc WH-12 torch. The engine's r ide tank, constructed of 17-7 ph i ess steel, is joined by a Heliarc W 3 torch mounted on an Oxweld M 7 carriage.

Provides versatility—The main as n for the use of inert-gas shielded- c elding on the *Redstone* engine is ersatility, according to Linde o cts. It can be used on many dif- re metals and thicknesses, deliver- g e same results on each.

l Heliarc welds undergo strict ra inspection before the engine is se bled and tested on a static test an After final factory approval, the gi is ready for shipment to ir ler Corporation in Detroit.

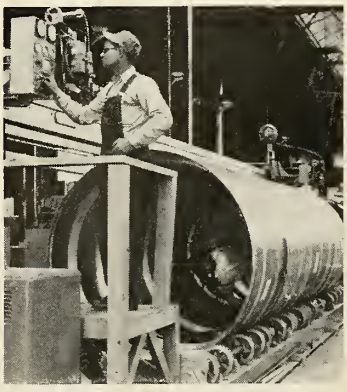
o insure quality, Reynolds em- oy an inspector for every four tech- cia s who work on the casings. The um um sheet and incoming parts e ecked for blemishes and tested th electronic devices to detect po- nti weak spots which might fail flight. Samples of each lot are with- aw from chemical analysis and a om te record is made of every part lec d to go into the missile. The sheet is then covered with protective paper tape to reduce the chance of being scratched during fabrication.

• **Fast speeds**—Each 20-foot sheet of type 5086 alloy is trimmed to size to form a shell meeting a .015-inch O.D. tolerance. After the sheets are rolled into a cylinder, the edges are cleaned, scraped and Sigma welded (inert-gas consumable-electrode) at speeds up to 100 inches per minute.



This longitudinal weld is made on an automatic Sigma SWM-3 machine, equipped with an HW-16 torch which is mounted on a Linde OM-48 side-beam carriage and controlled by a Linde SCC-1 control. The shell is then trimmed in length to a .020-inch tolerance and aluminum "Z" rings are spot-welded inside to support the shell.

Eight shells of varying lengths are joined to form the center section, or fuel tank, of the *Redstone*. These shells contain the bulkheads of the tank. The shells are assembled on another automatic Sigma SWM-3 machine and girth welded at speeds up to 55 inches per minute.



Power settings are usually 160-250 amp., 20-22 volts. Average welding time is only 4 to 10 minutes, but preparation takes the major part of time due to the extreme care required. First, the weld area is scrubbed with trichlorethylene, then the edges of the sheet are scraped with a special power scraper to remove oxide. Several power interlocks are provided to prevent machines with heavy electrical-current drains from starting during the critical weld cycle.

Prior to welding, a sample weld is x-rayed and checked for physical properties. After welding, each weld is x-rayed to doublecheck weld quality. When the center section meets radiographic and dimensional inspection, a series of aluminum pipes—which carry liquid oxygen, alcohol, or other fuel—are welded in place. The completed section is then ready for hydrostatic test, calibration, chemical cleaning, final assembly and finishing.

When the center and tail sections get final factory approval, the casing is forwarded to Chrysler Corporation in Detroit where the engine and instrumentation system are added to the ballistic shell to form a completed *Jupiter-C* or *Redstone* missile.

SIGMA welding is used by Reynolds Metals to make longitudinal weld on *Redstone's* center section.

ANOTHER Sigma machine makes a girth weld on *Redstone* fuel tank.

BRITISH ASTRONAUTICS

Government evasive on how much will be spent for space flight program; planetary probes and manned flight ruled out already

by G. V. E. Thompson

LONDON—British effort in the field of space research has so far been confined to the vertical sounding of the upper atmosphere with a few *Skylark* rockets, the tracking of U.S. and U.S.S.R. satellites and the analysis of the data obtained. Now government approval has been given for the establishment of a British spaceflight programme.

Government spokesmen have been evasive as to the expenditure involved, saying only that the sum spent would be hundreds of thousands of pounds, rather than millions, and that Parliament would not be committed to large or unlimited sum of money. A steering committee under the chairmanship of Sir Edward Bullard, F.R.S., has been appointed to advise on the allocation of money to the various projects.

At the moment no precise programme has been agreed upon, though it has been decided not to build planetary probes, not to undertake manned flight, and not to include animals in any launchings. Design studies have been put in hand for adaption of the *Blue Streak* and *Black Knight* rockets for launching satellites weighing 1000 lb. into orbits some hundreds of miles above the earth. It is expected that these studies will take about six months; the first satellite vehicle will probably be ready for firing in about two years' time. The likely design is a three-stage vehicle. The first stage would be *Blue Streak* (as yet unfired), the second would be *Black Knight*, and the third would be some solid-fueled rocket.

The R.A.F. teams at present being taught to fire *Thor* rockets will probably be responsible for the launching of the British satellites. It is too early for launching sites to be known—the most likely choice is the Woomera rocket range in Australia. If other Commonwealth countries participate in the programme, Kenya would be very suitable for launching satellites into equatorial orbits, but lacks the necessary ground facilities. The money to be allocated to the programme is not intended to cover the cost of constructing launching sites, but only design of the vehicle, adaption of military rockets and development of satellite instrumentation.

The greatest effort will be in the field of instrumentation; the series of experiments at satellite altitudes which scientists consider desirable would take over 40 years to carry out, even for a country with a space research budget as large as those of U.S.A. or U.S.S.R. Britain cannot hope to cover all that might be done, so a selection will have to be made.

The initial experiments will be an extension of the present *Skylark* sounding rocket programme, and will include use of an improved *Langmuir* probe for measuring atmospheric composition and temperature, magnetic field measurements, mass spectrometry, and meteorological studies. Ultra-violet and X-ray astronomy are other potential lines of research.

The instrumentation will be available before the launching vehicles, so advantage will be taken of the U.S. offer to COSPAR to fly other countries' equipment in American satellites. Professor H. S. W. Massey, Chairman of the British National Committee on Space Research, is shortly to lead a team of experts who will visit Washington to discover how much help can be expected, when, and on what basis. Following questions in Parliament, the possibility of joint action with the U.S.S.R. is also to be studied.

• **Transatlantic radio via moon**—Britain and the U.S. have cooperated in carrying out tests of the moon as a mirror for transatlantic radio communication. The experiments have been successful and have commercial and military potentialities.

Studies of radar echoes from the moon have been made since 1946, and Dr. John Evans of the Jodrell Bank radio telescope research station in Cheshire, England, advanced the theory that these echoes returned from quite a small area of the moon's disk. The absence of scattering indicated that it should be possible to bounce back signals carrying messages wit loss of intelligibility. This was de strated last year at Jodrell Bank signals transmitted and received a same spot.

Pye Telecommunications Ltd Cambridge, England, became inter and provided a standard 1 kw., mc transmitter for the transatl experiments, in which the 2 diameter Jodrell Bank radio teles sent messages to the moon. The flected signal was received at the 84-ft. diameter dish of the U.S. at Sagamore Hill, Hamilton, M which has only just become o tional and can only receive at pre A message in Morse sent from Eng read: "We will have no trouble fishing boats on this circuit," allu to the Russian trawlers susp recently of tampering with Atl cables. This was followed by transmissions.

Pye's are to produce a diameter radio telescope with power and higher frequency for f experiments. These will include si tests with the planet Venus (which be at its nearest to the earth in tember), and later with large inf artificial satellites. Use of the is limited to the time when it view of both transmitter and rece However, the method is not aff by ionospheric disturbances.

• **Cryogenic propellants**—The r engineer's approach to the handlin cryogenic liquids used as propel (ammonia, methane, hydrogen, oxy oxygen difluoride, and fluorine) discussed by D. Hurden of the Havilland Engine Co. Ltd. in a p read in London at a joint meetin the Institute of Refrigeration and Low Temperature Group of the P cal Society. Particular reference made to the *Snarler* and *Scre* rocket engines developed by strong-Siddeley Motors Ltd. for r aircraft (later abandoned). For mis delivery to launching sites by insu pipeline from central storage are preferred to the road tankers with the rocket aircraft. If nitr gas is used to pressurize liquid ox tanks, to prevent it dissolving in contaminating the LOX, the two be separated by a hollow piston; phragms of goatskin or kangaroo have been suggested, but the q of the material is variable.

The *Screamer* LOX pump wa signed to deliver 25 lb./sec. at 80 It ran at 20,000 rpm. and abso about 120 H.P. It was mainly structed in stainless steel, the ox seal being an optically flat stai steel ring soldered to a bellows bearing on a rotating sintered br disk.

FBM Sub Provides New Market

With 45 missile-launching boats possible, lion's share of some $4.5 billion should go for support equipment

by Donald E. Perry

ROTON, CONN.—More than $2
n has already been provided for
olaris Fleet Ballistic Missile pro-
r and the next five years may see
er $4.5 billion expended for this
ent weapon system.
mazingly enough, the lion's share
e funds will go for support equip-
r in this gigantic program which
be marked by the launching of
rst of possibly 45 fleet ballistic
e submarines this week at Electric
a Division of General Dynamics
r here.
ne $100 million George Wash-
t (380' and 5400 tons), which will
s first Lockheed *Polaris* missile
year, slides down the launching

d in development.
This will give the nation, by the
next year, three *Polaris* sub-

Fifth of a Series on Missile Support

marines with nine expected to be under construction. Cost? Well, $2.063 billion has been provided to date for the FBM program, bringing into being a vast program which includes:

- The USS Compass Island, a navigation development ship which has been testing instrumentation for more than two years.
- Another ship, the USS Observation Island, which soon will conduct a missile firing at sea; and other auxiliary support vessels.
- Six FBM submarines, with keels for three more subs to be laid this year, bringing total construction to nine.
- A tender especially converted to maintain *Polaris* submarines on station outside the continental United States.

The money which has been appropriated through FY 1959 will buy missiles for the first five boats and will continue the missile's flight development and testing program.

- **Six in '60?**—How about FY 1960? The Navy is requesting $611.7 million for continuation of the program and there appears a distinct possibility

WORKMEN put the finishing touches on the George Washington, the nation's first FBM submarine to be launched at Electric Boat Co. June 9.

that a *Polaris*-minded Congress may authorize additional millions for possibly six more submarines.

This was brought out in hearings before a Congressional appropriations subcommittee earlier this year when Rear Adm. W. F. Raborn, director Special Projects office, Bureau of Ordnance, was questioned on the add-on cost of a six-boat program for FY 1960. For the six submarines a $600-million figure was given along with $51 million for additional support.

FY 1960 funds for the *Polaris* program will do several things:

1. Permit construction of a second FBM tender designed from the keel up for its missile role, rather than conversion of some existing ship.

2. Provide advance procurement of long leadtime components for three FBM submarines, bringing the total number of boats to 12.

3. Provide additional *Polaris* tactical missiles.

4. Continue an extensive flight test and evaluation program, and maintain R&D effort on reliability.

Here's how the amounts break down:

Operation and maintenance, $19,-275,000 (This would provide continuous support of test vessels and facilities, give upkeep and repair capability; give ship and ashore type training equipment; provide some $1.3 million in communication equipment and another $3 million in a "service-wide operations" activity).

Shipbuilding and conversion, $54,-042,000 (New tender construction would be $61 million, principally from previously appropriated funds); long time lead items for three boats; basic reactor components, cores, and the ships' SINS inertial navigation equipment.

Procurement of ordnance and ammunition, $314 million (of this $84.5 million would go for tactical missiles; $107.2 million for missile components for development test; $13.4 million for operation of flight test program; $77.2 million for production facilities and other missile system support; and $31.6 million for training, logistics and weapon system support).

• **Participation**—And how are suppliers participating in the FBM program? Electric Boat Co. points out that through January 55% of direct purchase orders under the FBM program went to small business firms. In the same period, small business got 38% of the dollar volume of stock inventory and 58% went into plant maintenance.

Actually, however, EB has only added perhaps 50 more suppliers under the FBM program. It acts more as an assembly participant in the gigantic jigsaw program with many items regarded as GFE (government-furnished equipment) under separate contracts by BuShips, BuOrd and Special Projects Office.

While Congress has almost overwhelmingly endorsed the *Polaris* FBM program, obsolescence of the FBM submarine frequently comes up for discussion.

Admiral Raborn points out that a weapon system does not become obsolete so long as it remains an "efficient instrument for the performance of its mission, in comparison with other weapon systems and in the face of existing defenses."

• **Growth potential**—He points out that the useful life of a submarine is 15 to 20 years, that the Navy is building a 1965 submarine and missile today and that everything that is going in is based on a potential and growth capability.

You have only to look down one of the 16 missile launching tubes of the George Washington to confirm this. While Navy will not give out any statistics on *Polaris*, it is generally conceded by the missile trade press that it has a length of about 26.5 feet and about a 5′ diameter. The Navy is still reluctant to talk about the size of George Washington's launching tubes (even though they were designed on practically 50-year-old standards of torpedo tubes). However, it is safe to assume that they could accommodate a future solid-propellant missile approximately 7 ft. in diameter and more than 40 foot long.

This will extend the range of *Polaris* to an ICBM category without any major revision of the FBM submarine, thus giving it a global coverage capability of 100% rather than an 80-90% of potential enemy targets as previously speculated.

• **Old & new**—It is no secret that the missile launching tubes operate on the tried and proven principle of torpedo tubes—air expulsion. Electric Boat Co. design engineers are inclined to gloss over their design achievement for the tubes and EB's FBM Project Engineer, William G. Atkinson even refers to them as "simpler than torpedo tubes." He adds that they are bigger and easier to service and maintain.

But back of this came good shipbuilding engineering. Included was a special air-ejection system for the missile. Another air compressor has been added to the submarine's system to handle missile launchings which probably will be made at 4500 psi.

With 16 missile tubes lined up of the conning tower sail in pairs eight, CG principles and additional sign parameters for water pumping trim compensation were major sideration. The George Washing a sister ship to the Skipjack—wo fastest submarine—differs only in addition of a 130-foot missile sec aft of the conning tower sail. Th are no provisions for reloading missile tubes from the submarine.

After the firing tube hatch c has been opened M/R has learne plastic diaphragm directly above missile reportedly keeps the missile Air pressure within the tube equal outside water pressure. The missil fired through the diaphragm, an special water compensation system to be installed to accommodate great change in weight.

One example of support equipm for the tubes are heat transfer u developed by Tranter Manufactu Inc. of Lansing, Mich. Each *Po* firing tube will have the units—w consist of embossed sheets of m welded together to form channels the passage of hot or cold wate maintain the solid fuel at the spec temperature at the time of firing. T perature will be maintained withi range of plus or minus three degree

• **Seats open**—One source says submarine missile men are taking new tubes in stride. In both the for and aft missile compartments on three decks are card tables of cribbage variety, nestled between tubes. Cribbage has been a fav submarine game for many years, submarine missile men apparently take advantage of the new-found sp

Atlas Parts Test Stand Produced by Rocketdyne

CANOGA PARK, CALIF.—A port Components Test Stand for all ele pneumatic and hydraulic parts of *Atlas* ICBM has been delivered Vandenberg AFB by its designer, ketdyne Division of North Amer Aviation, Inc.

The three-ton unit, first of se to be constructed, will make it pos to check out *Atlas* parts at SAC sq ron level. Incoming spares or co nents removed for service or r can be field-checked prior to inst tion in the missile.

Under design and fabrication the past year to meet requests of vair, Rocketdyne and *Atlas* su engineers, the test equipment will dle all parts that are field repair including Convair-developed co nents.

A Mammoth Gantry for *Saturn*

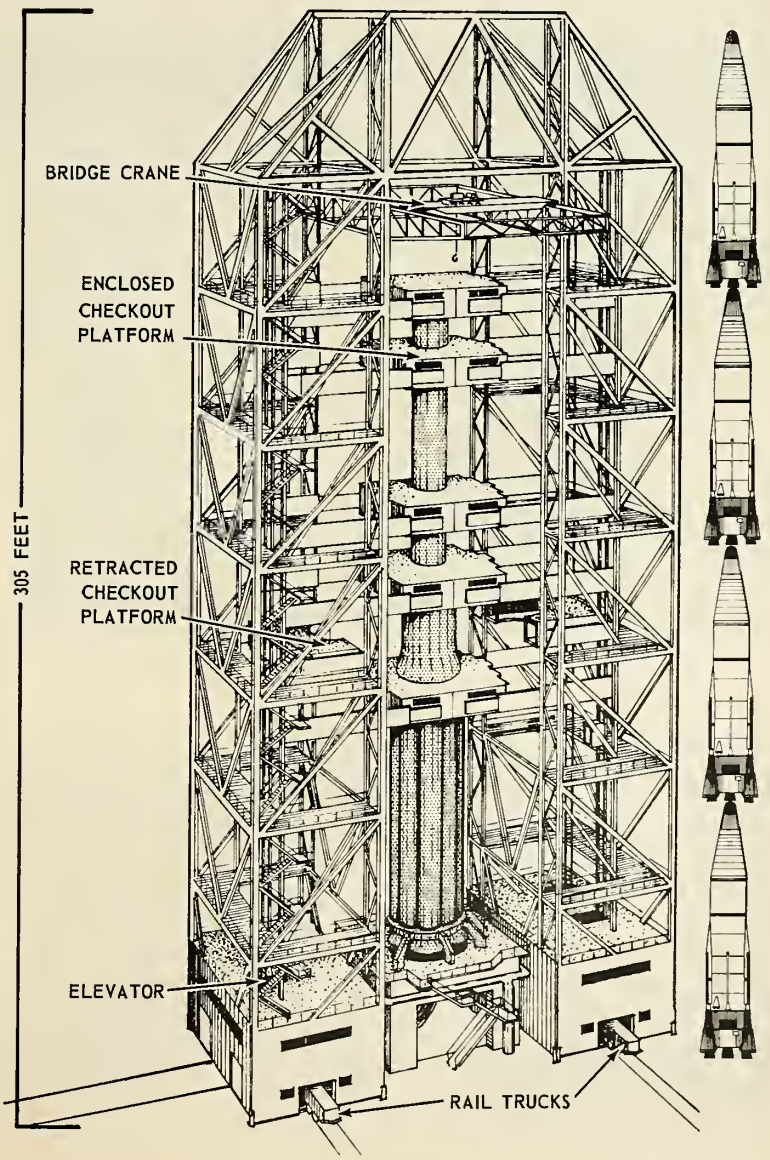
Structure will cost $9.5 million with test tower, opening new dimension in missile support equipment

HUNTSVILLE—America's biggest e vehicle—the 1.3-million-pound- t *Saturn*—will be assembled in nation's largest gantry, a 305-foot ter which will tower into the sky igh as a 28-story building or a of four *Atlases*.

onstruction of the huge mobile gantry is scheduled to begin ly. It will signal a new era in the of missile support equipment for r space vehicles yet to come.

he Army Corps of Engineers, n designed the structure with the Ordnance Missile Command and ice H. Connell & Associates, ai A&E firm, says bids will be itised soon. Construction may be or at Cape Canaveral.

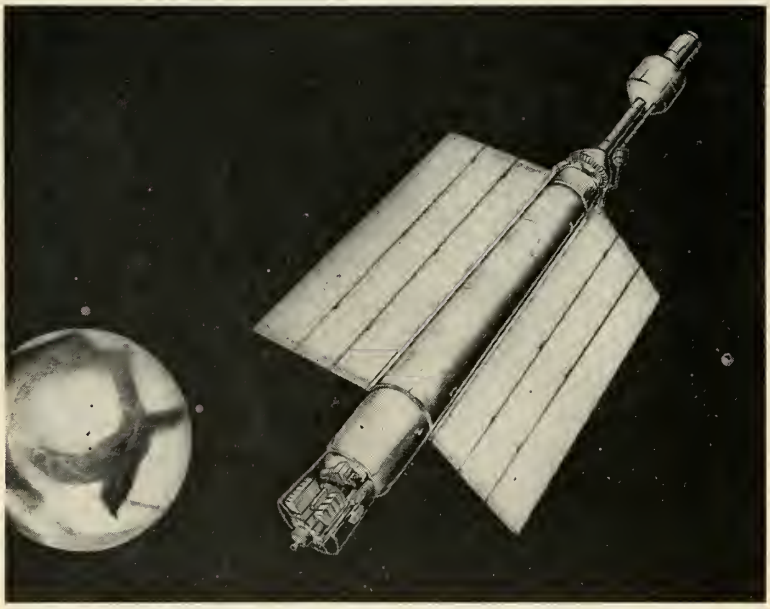
stimated cost of the gantry and t test tower will be $9.5 million. static test stand towers are 135 high, by comparison, and cost d $1 million apiece.



he gantry to accommodate the tage ARPA-ABMA *Saturn*, which ave a cluster of eight H-1 Rocket- *Jupiter* rockets as a booster , May 25, page 36), will be a etely self-sufficient unit. It will n "on-board" diesel electric gen- s sufficient to power all equip- and propel the structure along ts of railroad tracks at 40 feet inute.

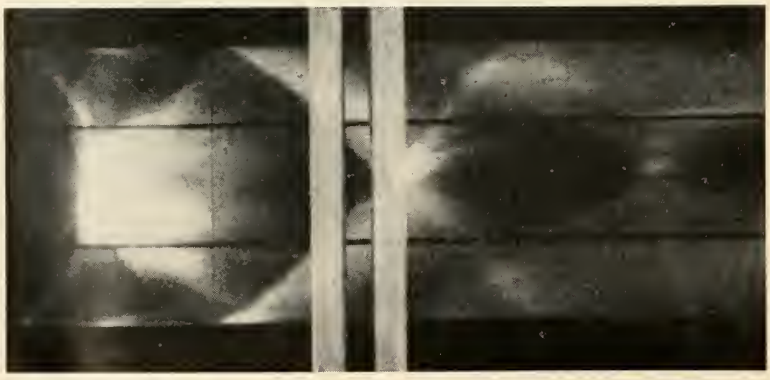
ecifications call for one freight wo passenger elevators. Bridge , vertically positionable from 43 25 feet high, will be capable of ing out to a point 20 feet beyond ructure. There will be six en- checkout platforms located at of stage interconnection, control uidance sections, payload and stage fueling and servicing.

nge of platform vertical adjust- will be 175 feet, extending from evation of 50 feet above the ing pad upwards to 225 feet. service platform is halved for re about the rocket vehicle, will be about 200 feet high. The platforms are retractable into er legs, facilitating the handling ckout equipment.



borate facilities have been in- corporated to provide for fire and lightning protection, personnel safety, heating and air conditioning.

Static firing of *Saturn's* booster-cluster is expected here some time this fall. Flight testing may come at the Cape next year. If the big gantry is built here, Corps of Engineers officials say it will be transported to the Cape as nearly intact as possible.



Plasma Engine Delivers Nearly 2-lbs.

Republic's experimental 'magnetic pinch' engine produces over 4000-lbs. at peak with 1700 sec. I_{sp}

PROPOSED MARS vehicle's folding "wings" would be heat radiators. The nuclear reactor would be housed in the nose with plasma engine in tail.

STREAK PHOTOGRAPH of cylindrical pinch was taken through 0.05 slit in upper electrode.

The advantage of the Republic

ne is that it is easier to get suffi-
ent mass movement from the mag-
tic pinch than from conventional ion
chniques. A patented "curved nozzle"
ilizes the pinch to form a shock wave
iston" which produces the high-
locity axial thrust. A further ad-
ntage is that the pulsing technique
bjects the engine itself to only micro-
cond-duration high temperatures. The
erall heating effect is small and no
oling is necessary except for long-
ration flights.

The plasma engine uses a heavy gas
ch as liquid oxygen or nitrogen and
rns it into plasma—a fourth state of
atter evolving from gases in which
e molecules are broken into electrons
d positive ions. This provides tre-
endous power for a comparatively
all amount of fuel.

• **Utilizes intermingled particles**—
cret of the plasma engine is a
ethod of compressing and accelerat-
g a fluid in a cylindrical magnetic
ld and shooting plasma out the rear
tremendous velocities. Unlike the
oposed ion engine which accelerates
ns and negative particles in separate
eams, the plasma engine utilizes the
ermingled particles in a single jet
rust. It can also operate on fuels
re readily available than those re-
ired for the ion engine, and attain
eater thrust.

The basic principle of the plasma
ch is illustrated in Figure 1. A 6000-
lt charge from a capacitor is dis-
rged into a gas confined in a cyl-
der, the ends of which are electrodes.
rrent then flows in the outside cir-
mference, or "skin," of the resulting
ized gas (plasma). The magnetic
ld set up by the flowing current ex-
s an inward force on the plasma
ylinder" causing it to constrict to a
n tube at the axis of the electrodes,
ing it the action of a piston. This
gnetic piston causes a shock wave
ich raises the temperature and pres-
e of the gas. If a hole were cut in
center of the right-hand electrode,
resulting energy could be released
ough it to provide a high-velocity
j

This principle is utilized in the
public engine and greatly enhanced
forming the electrodes into a curved
zzle. The piston action is very simi-
to that described for the basic en-
e in Figure 2. The pinch effect
ves the gas towards the center and
hock wave is generated ahead of the
on. The curvature of the electrodes
ces the wave into an axial direction.

The compressed and accelerated
s then leaves the nozzle-electrode at
h velocity. The exhaust nozzle is
igned to convert a substantial
unt of thermal energy existing in
exhaust to kinetic energy. At the

POWER PACKAGE for Mars vehicle. Units shown would weigh 14,000 pounds. Development of direct thermoelectric source would eliminate turbine and compressor.

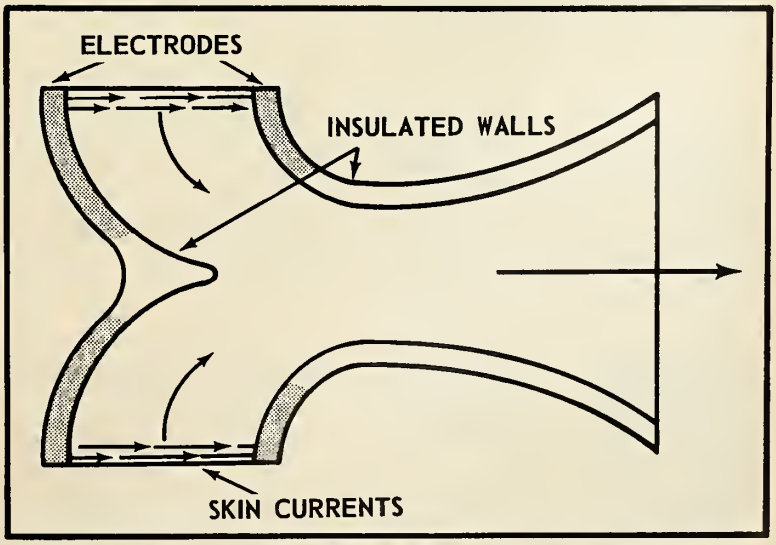

FIG. 2—Republic's patented "curved nozzle." Magnetic pinch produces shock wave in throat which expels high-velocity mass to develop thrust.

R/M PYROTEX® REINFORCED PLASTICS ...DEVELOPED TO ENDURE THE FIERY REALM OF THE ROCKET

Light, strong, heat resistant . . . for low-cost, precision fabricated rocket parts— both structural and aerodynamic

Smooth, strong rocket fin and nose cones made of R/M Pyrotex resist aerodynamic heat; have low, uniform ablation rate. The fin shown was subjected to tests at Mach 7.

Looking for a material that will withstand the elevated temperatures generated by missiles and rockets—internally from burning propellants, externally from aerodynamic heating? Must this material have good insulation and thermal properties, chemical and water resistance, and take a smooth finish? If so, one of R/M's family of Pyrotex reinforced plastics may be the solution to your problem.

The many outstanding thermal and structural features of R/M Pyrotex have led to its use on almost every U.S. missile. It has been fabricated into parts such as nose cones, fins, igniter tubes, rocket throats and sliver traps. Its exceptionally good dimensional stability makes possible mass production to precision standards. And it is low in cost. Write for additional information.

Radiation Effects: What's Being Done?

by Charles D. LaFond

CHICAGO—Nuclear radiation enviments born of our scientific and ineering advances in recent years essarily have altered requirements test methods for electronic coments.

The problem was recognized early, both the military and industry been testing a multitude of deand components with particle and radiation at varying energy levels. goal of course is to acquire enough vledge to evolve new or modified ronic components that will funcreliably under otherwise damaging tion.

uch radiation can occur from a ear explosion or in the field of a ar reactor. The design engineer is bled primarily with the latter. The or is a problem only when insuffishielding is provided. This occurs a weight limitation prevents the of suitable shielding. And space air-supported vehicles in our presoncept inherently demand this limn.

he proposed nuclear-powered ram*luto,* the boost-glide *Dyna-Soar,* other possible orbiting satellites by their nature, require electronic onents capable of surviving in nments of sustained high nuclear tion.

he Nuclear Physics Department of ral Corporation, located here, has a strong arm in the continuous Force program investigating the se effects of unconventional enments. The program has been sup since January, 1955, by a series search contracts from the Elec- Components Laboratory of Wright Air Development Center. Admiral currently is working under a $2-million contract to study contemporary and future requirements for electronic components.

• **How it happens**—The two damaging constituents of nuclear radiation are neutrons and gamma rays. In all tests, the energy spectrum of each must be known since variations can have damaging effects ranging from normal extremes to complete failure.

In addition, two other damaging conditions must be considered: large amounts of ozone are produced in the local atmosphere by highly ionizing gamma radiation; and increased temperatures in components will result from gamma radiation absorption. The ozone problem will be serious only during long sustained flight.

Admiral research has indicated that about 0.01 watt/grain is dissipated in components (subjected to radiation in the CP-5 research reactor at Argonne National Laboratory), and that the resulting heat rise will effect a derating in performance or require supplemental cooling equipment.

One of the most confusing problems Admiral has faced is the current use of different dose units in technical literature describing magnitudes in particular environments. (Example; Roentgen Equivalent Physical (rep) or Mammal (rem).)

The problem is readily evident. A neutron dose rate of 10^4 fast neutrons/cm²/sec equals 1 rep/hr. Also, 7 x 10^5 gammas/cm²/sec of 1 mev energy equals 1 rep/hr. But it has been proved in the laboratory that radiation-induced damage to a resistor by an equivalent rep dose of neutrons far exceeds that of a rep dose of gamma rays. Without the knowledge of the neutron-to-gamma ray ratio, an apparent fallacy exists.

Research to date has provided other highly significant general conclusions:

• Thermal characteristics of proposed nuclear-powered space-aero vehicles will severely limit capabilities of electronic components.

• The provision of sufficient gamma ray shielding in these vehicles is doubtful and the magnitude of gamma heating will vary directly with reactor power and shielding.

• New techniques may have to be developed to transmit or receive from these vehicles. As a result of attenuation and share rotation suffered by an

RADIATION-INDUCED damage to image orthicon tube by 18-hr. exposure to the CP-5 nuclear environment.

RADIATION damage received by oil-filled capacitor. Distortion and swelling is caused by gas evolution in the hydro carbon insulation oil. Again cause was CP-5 environment.

electromagnetic wave propagated through the ionized medium, complete reflection from the ionized boundary layer can occur. This same ionization also tends to limit impedance levels within the various circuit devices. The situation worsens with increased reactor power, but is dependent also on the presence of an atmosphere.

• The neutron-gamma ray dose received by any component is a function of both the neutron and gamma ray dose rates at the component position and of the total time of irradiation.

• Although some conventional electronic components operate reliably in radiation of moderate severity, future high-power weapon systems will necessitate radically new components. More work must be accomplished on electronic components development if they are to be suitable for contemporary nuclear-powered vehicles.

Typical relative environments to which space-aero vehicles in sustained flight will be subjected are shown in the table below. (More precise data are available but these are still classified for security reasons.)

• **Component damage**—A summary of some of the more pronounced effects of nuclear radiation will indicate the seriousness of the problem. In many instances, damage is very severe.

Irradiation of components in the Argonne CP-5 reactor represented dosages comparable to those which would be expected in contemporary nuclear-powered vehicles. The time period was approximately 3000 hours maximum.

Electron tubes demonstrate rather marked effects: most glass envelopes shatter; all glass envelopes darken. Borosilicate-type hard glasses are most susceptible to these shattering effects, attributed to neutron bombardment; discoloration results from gamma rays.

In general, all photo-sensitive components are sensitive to gamma rays, but gas-filled tubes and ionization devices are not. The most notable result observed with electronic tube devices was the rapidity of failure once the radiation damage began—often occurring within a few minutes.

Results of in-pile tests of semiconductor devices are sometimes conflicting. Damage also seems to vary more with manufacturing methods than with the properties of the solid-state components under test.

During bombardment of semi-conductor diodes, it was found that the forward currents decreased and backward currents increased. Oddly, post-exposure tests indicated partial recovery. In the transistors tested, gain was found to decrease under irradiation. But there were exceptions, since some devices showed a gain increase followed by a greater decrease later.

With respect to radiation resistance, silicon generally proved less susceptible, but again there were instances when the reverse was true.

In general, vacuum tubes have shown greater resistance than semiconductor diodes; the diodes have done better than transistors.

Crystal units tested indicated appreciable damage to component parts under gamma-neutron irradiation. Quartz structures darkened and fiber board and glass-to-metals seals in particular proved unsuitable.

Various types of capacitors were tested using mica, glass, ceramic, oil impregnated paper, and plastic. Both capacitance and dissipation factor were observed under irradiation.

Swelling and distortion were very apparent in oil-filled capacitors, resulting from a characteristic gas evolution. In general, capacitance decreased, dissipation factor increased. All of the other types of capacitors showed only slight capacitance change with somewhat more sensitivity in dissipation factor.

	Time (Hours)		10^3	10^3	10^3	10^4
Operating Life (Hours)			2×10^3	10^4	10^4	10^5

TYPICAL relative environments to which space vehicles will be subjected.

Different types of resistors w irradiated and, as might be expect wirewound types showed the least s sitivity. In general, resistance chang either because of damage to the c ducting material or the insulation. also is believed that parallel condu tion paths from the radiation-induc ion fields may have lessened res ance. This varied with reactor intens for all types of resistors.

With respect to wire and insulati results of irradiation are fairly consta —insulation material deteriorates lo before any appreciable change in t metal conductor occurs. As the rad tion field is increased there is a c responding decrease in insulation sistance, probably associated with c rier production in the material.

• **Contemporary and future co ponents**—As indicated above, many our present components are not se ously affected by expected radiatio from contemporary nuclear-power vehicles. But, as indicated in Table the environments of the future wea ons systems have factors of from to 10^9 probable dose rates above th of existing facilities. Similarly, therm environments will double in range. do not now possess components capa of functioning reliably in such e tremes.

The combinations of extreme e vironments will cause even grea complications. The big problem is t limited size of existing nuclear reacto which will not permit the simulati of synergetic environmental con tions. A partial answer would be velopment of small environmen chambers which might be placed side an existing irradiation facility.

• **Future design**—What can be do to provide more suitable compone for such damaging environments? A miral, as a result of its research, lieves there are several practical proaches:

(1) Minimize damage by selecti of component materials with high sistance to gamma-neutron bomba ment: high-purity mica, ceramics, ra ation-insensitive glass (under develo ment), and the use of inorganic rath than organic materials.

(2) Higher temperature operati This is based on the concept that crystalline and vitreous structur damage by radiation can be voided an annealing process. The ideal c would exist when the rate of radiati induced damage equals the rate annealing of damage areas.

(3) The best approach proba will be development of wholly n solid-state components which will designed for use in these difficult vironments.

Miniaturization—A Swelling Tide

Chain reaction of new breakthroughs could lead to microscopically small parts before trend runs its course

Heyward E. Canney, Jr.

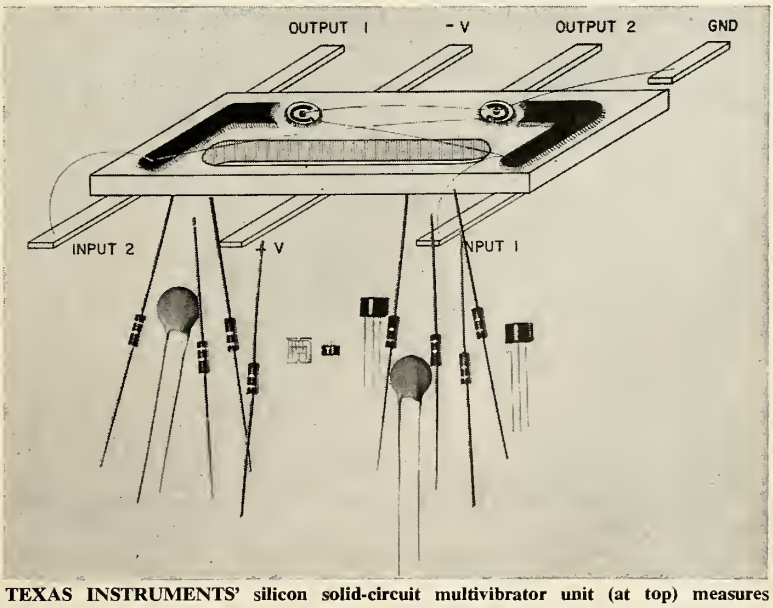
SHINGTON—A bold new engineer-cipline fostered by the advent of ex weapon systems and high-e rocketry, miniaturization is al-a cornerstone of guided missile ace-flight technology.

e small artifact has been known ntiquity in art, jewelry, and the of documentary pinhead in-ns, but it can hardly have been ective undertaking for more than de or so. There was no need for re the complexity of rapid war-diotelemetry and automatic com-And before modern quality con-d reliability concepts, it was not feasible.

t only has miniaturization made e products available to the pri-tizen, it has so condensed tech-systems that large numbers of nits have created new systems y. New capacity, in turn, has new vistas, generated new goals then demanded still further min-ition.

ividual components shrink y in size with each new break-n in concept, materials, design, brication—and then swarm on ne again in more-dizzying pro-At the present rate, there is a enuine prospect that individual as we come closer to compre-g the basic behavior of matter may become invisible to the eye.

What is it?—Miniaturization is an ring discipline devoted to re-the size of a useful artifact to one or more functions which in scope or efficiency specifi-cause of the miniaturization. It is applied to individual parts to total size of an assembly, com-or system fabricated from such Although the discipline now in-cludes mechanical idioms, its untimate implications involve matter and energy of a fineness which begs the distinction between electricity and mechanics.



Miniaturization aims to increase performance and/or portability, or to prevent non-portable devices from growing to unmanageable size. The result is properly a tool or technical instrument generally involved with handling information in some form.

It is achieved through scaling down dimensions, using new materials for lightness in basic or aggregate structure, involuting and telescoping structural configuration for reduced space envelope, and adopting new concepts of interplay between matter and energy.

It is aided by new philosophies of fabrication which may not be intrinsically miniature themselves but which enhance the general undertaking—such as (in electronics) the use of printed circuitry, modularization, and intrinsic agencies for drawing all or part of a device's operating energy from the environment.

• **Methods and factors**—The most direct method is scaling down, which can be done when function does not directly depend on size, or compensations must be made. Resistors, for example, must adopt a new active element of greater resistivity beyond a certain point. A voltmeter ¼″ in diameter has dubious utility, though one doubtless could be built.

Redundancy is made possible, but must be used intelligently to avoid

TEXAS INSTRUMENTS' silicon solid-circuit multivibrator unit (at top) measures less than 1/4x1/8x1/32 inches but has equivalent of conventional components shown.

bogging down through mechanical and electrical loss accumulations. And one should be willing to include a non-miniaturized part where its performance is clearly better.

Lightness of material of carefully chosen properties is utilized, though resistance to environment, vibration, acceleration, impact, and internally-generated heat must be considered.

Redesign of intimate and general structure is very important: individual parts may be placed closer together; structural support may be involuted; parts may share interface, be placed inside each other, or be made both functional and structural at the same time.

Mechanical linkages and power trains may be shortened, rotating parts substituted for sliding ones, and so on. Primary power agencies may be arranged to eliminate intermediate step-up or step-down. This makes for compactness or high component density, and hence greater weight, which must also be reckoned with in the end result. Problems of heat dissipation, magnetic isolation, and access for service also arise.

Techniques of fabrication include printed wiring and circuitry, which permit automated dip-soldering and flatness for dense stacking, and sometimes the use of stampings and extrusions. Micromodularization, made possible in part by deposit of filmy circuit elements on wafers which are then stacked and potted, promotes shortness of leads, positive connections, low loss, and structural integrity.

Deposited elements spring from a still more basic practice of producing elements from solid-state materials such as semiconductors, or magnetostrictive or piezoelectric substances from an essentially chemical origin, and stretching into thin ribbons.

Construction may be adapted to accommodate twistors, cryotrons, MASERS and ferrites, which may demand exotic provisions of environment such as extremely low temperature.

Finally, systems may be reduced by relying on extract of power from gravity, buoyancy, friction, fluid intake for chemical action, radiations, static- and piezo-electricity, and magnetism. In a few cases all power may be so derived (though this is often risky) and in others, minute amounts of energy for reference or control will suffice. In handling data, one may convert the form of coding and telemeter for reduction elsewhere.

• **Why miniaturize?**—The impulse springs partly from the way Man looks at his relationship to the total environment, and in part from certain basic realities of interplay between matter and energy.

In looking at the environment, one compares goals with resources. The Russians surveyed an essentially mediocre average of craftsmanship in a vast labor force, built things to relatively relaxed tolerances, and got crude and heavy results. These doubtless included nuclear warheads, which needed large rockets for delivery, and which were crude and heavy for the same reason. The word "crude", here, hardly means oxcart crudity. A MIG is a lot of airplane, and a very crude 10-megaton ICBM warhead detonating on target will be distinctly noticeable.

The comparison is with "sophistication"—the lavish resources of American money and craftmanship combined with a yen for convenience resulting from disinterest in world conquest. Convenience, among other things, meant reducing both non-portable and portable systems to economical and manageable size. Before we realized it, we were involved in a chain reaction of alternate conveniences of miniaturization and acceptance of greater and greater challenge opened up by complexity. We considered our resources and decided on many peaceful conquests rather than one warlike conquest.

In the process, we happily discovered that the richness of our approach revealed the above-mentioned physical relationships of interplay between matter and energy. We discovered, for example, that with increasing RF frequency, electron-tube geometry —based on the concepts of the time— required reduction in tube size in obedience to such requirements as interelectrode capacity. Power levels eventually dwindled to useless amounts, except in the laboratory, and electrical forcing in practical equipment only burned out the tube. Physical laws are implacable, and the only thing left was to start with a new approach. We eventually came up with transistors, and it wasn't long before everything was being miniaturized.

Conceptual daring paid off handsomely. Proliferation of parts created complex systems, which permitted the audacious approach of "doing big jobs conveniently." It turned out we also did them better, faster, and more cheaply.

• **Advantages**—Aside from the general desirability of convenience, there were direct benefits in technical performance. Parallel duplication improved reliability . . . and you can afford duplication if what you are replicating is small and light. Also, things can be done with the same ability when parts are small, since tems can get more complex.

Portability is advantageous in planes and missiles because it incr capacity and performance per weight and volume. As for non-p bility, if you are erecting an ambi digital computer, it is a real bene contain it in a room rather th whole building.

Space and weight reductions a obvious boon to satellite and launching systems, because it's ch to use a smaller rocket to loft the load. In mass production, small are generally cheaper per unit, an payload itself also costs less. In lites and probes this is no trifle.

Removal or reduction in nun of moving parts increases reliab Micromodules, which permit stan ization and potting, have impr structural strength and environm protection. Shortening leads and ages reduces power loss and pe smaller power sources, again red size and weight. Printed or depo wiring and circuitry permit auton production, which saves money.

Component density permits l duplication in parallel to increase all capacity, or deal as a team specific functions to promote reliab In many cases, sensing elements reduced area have improved sign noise ratios.

• **Trends and prospects**—Emp cally higher component density is way. Until the recent breakthr about 60,000 parts per cubic foot the limit. About 300,000 looms fo reasonably near future, and som perts forecast densities between 5, 000 and 34,000,000 if whole sys can be fabricated solely of mo like the Texas Instrument multiv tor, the Westinghouse module, others. The Air Force is already ously studying a new realm of "m tronics" . . . involving volumetric aturizations of 1000:1.

Wider operational tem ture ranges are in prospect, thank only to extensive encapsulation but to the closer packing resulting standardization of modules. Auton production, increasing use of m modules, and automatic testing of systems and systems seem likely, v the assembly jig is constantly conn to testing instruments, so that te can proceed as the systems are a bled. Testing itself will be more ous, and greater confidence may i diately be placed in the received e ment.

Data itself will be subject to so

Beryllium Structure Made

BALTIMORE—The Martin Company has successfully fabricated structurally sound beryllium sheet material which has been used to construct the world's first beryllium structure.

Use of beryllium in frame structures will make it possible to solve many of the aerodynamic and structural heating problems associated with space flight and re-entry of the earth's atmosphere at speeds up to 18,000 miles per hour.

Martin engineers believe the achievement brings interplanetary travel within the realm of practical engineering design because frame material research has not, to date, kept pace with the rapidly advancing state of the art of propulsion research.

The project was accomplished under an Air Force contract placed with Martin in the summer of 1957. Development and fabrication was performed in conjunction with Nuclear Metals, Inc., Concord, Mass.

• **Other approaches**—The Martin approach to beryllium is just one of many avenues now being explored. Manufacturing Methods Division of Air Materiel Command is developing test criteria to evaluate the Martin program as well as work being done by Brush Beryllium Corp. under AMC contract.

The sheet program is only one of many now under way. Others include: a contract with Beryllium Corp., Reading, Pa., to determine the feasibility of making beryllium castings and to develop methods for producing shaped castings; Northrop Corp. is attempting to develop a process for producing extrusions of adequate aircraft quality; Ladish Company, Cudahy, Wis., is working to develop forging techniques to permit the production of beryllium parts and to develop necessary engineering data; Kettering Laboratory, University of Cincinnati, is trying to develop sufficient industrial, medical, toxicological and industrial hygiene engineering information to safeguard industrial personnel working with beryllium.

Still other contracts include: Brush Beryllium to improve the ductility of beryllium sheet by addition of alloys; Avco to develop techniques for joining beryllium; Nuclear Metals Division to fusion weld beryllium; Lockheed Aircraft to study the effects of notches and cracks on the structural quality of beryllium; and Armour Research to make casting studies.

• **Merits**—The Avco research possibly deals with nose cone technology. It is interesting that in recent testimony before the House Appropriations Subcommittee, Lt. Gen. Roscoe Wilson, AF deputy chief of staff for development, commented that a beryllium nose cone would weigh about 13 pounds while a comparable copper cone weighs approximately 100 pounds.

Beryllium is lighter than magnesium, has a melting point twice that of aluminum and a stiffness factor exceeding that of stainless steel. All desirable attributes for missiles and space vehicles.

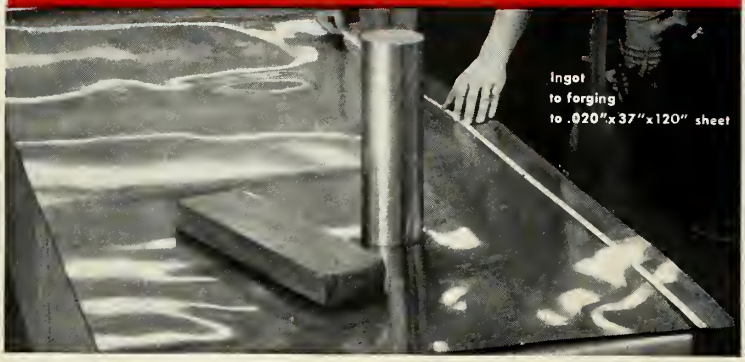
The combined properties of beryllium are superior to all other structural materials from the standpoint of strength, stiffness, heat absorption, and lightness in weight, Martin engineers said. Its use in frame manufacturing will enable designers of space vehicles to effect vital savings in weight, fuel loads, and vehicle size.

In addition, beryllium structures may not require complicated cooling systems to compensate for structural heating caused by friction at the time of high speed re-entry. Instead, they said that ordinary insulation may be sufficient for structures made of beryllium.

Ballistic missiles can utilize beryllium in nose cone construction to take advantage of the material's great heat storage capacity. Beryllium can absorb two-and-a-quarter times more heat than any other structural material under conditions of a given rise in temperature.

• **Barriers cleared**—Until now all characteristic forms of beryllium—castings, forgings, rolled sheet, etc.—have exhibited non-uniform properties and brittleness akin to glass. This stumbling block has been largely removed with the development of sheet material possessing homogeneous properties suitable for structural fabrication.

Brittleness in beryllium forms has been due primarily to planes of weakness in the metal's metallic crystal. Martin and Nuclear Metals, Inc., took an unusual approach in solving this problem by attempting to control both the crystal size and orientation during basic sheet fabrication. Test results on both the material and the completed structure indicate that excellent properties have been achieved, the engineers said.



Other limitations for beryllium usage, however, still remain. In the first place, forming or bending the sheet can be performed only within a finely defined band of hot forming temperatures. It can presently be joined only with fasteners, and cannot be fusion welded.

As for extrusions, forgings, and rolled sheet forms, Martin tests indicate that all continue to yield crystal orientations resulting in the familiar brittleness.

with

High Strength-To-Weight at HIGH TEMPERATURES

FANSTEEL 80 METAL

Alloy—Columbium-zirconium

Melting Point—4350°F.

Density—
8.6 grams per cc (0.311 lb. per cu. in.)

Tensile Strength—
Annealed 70°F.; 47,000 psi.

Stress-To-Rupture—
100 hr. 2000°F.
(argan) 18,800 psi.
500 hr. 2000°F.
(argon) 11,000 psi.

Other Praperties—Ductile to brittle transition temperatures in annealed state are well below raom temperature.

Advantages and Uses—Extremely high strength-ta-weight ratia far high temperature applicatians. Excellent weldability, ductile welds with little or no tendency to fracture in heat affected zones. Easy fabricatian at room temperature, as worked ar annealed. For missiles, rockets, spacecraft, ather high heat applications.

FANSTEEL 82 METAL

Allay—Columbium-tantalum-zirconium

Melting Point—4550°F.

Density—
10.26 grams per cc (0.371 lb. per cu. in.)

Tensile Strength—
Annealed 70°F.; 55,000 psi.
2000°F. in air; 29,600 psi.
2400°F. in air; 11,700 psi.

Stress-Ta-Rupture—
100 hr. 2000°F. (argon) 17,500 psi.
500 hr. 2000°F. (argon) 13,500 psi.

Other Properties—High oxidation resistonce compared to pure refractory metals. Oxide film is tenacious, non-volatile, tends to form protective coating. 16-haur, 2000°F. tests in flowing air show remarkably low scaling af 0.01 cm.

Advantages and Uses—Exceptionally suitable for air-frames and certain missile applications. Provides desirable strength-to-weight advantages at higher temperatures plus the same workability, weldability and ductility of Fansteel 80 Alloy.

AVAILABLE in ingots, fargings, bar, rod, plate, sheet and fabricated parts.

pressure of 5 million atmospheres chieved by a group of Soviet ex- enters acting on the initiative and ctions of Academician Y. B. vich. In reporting this accomplish- *Komsomolskaya Pravda* admits 'this monstrous pressure" lasted moment, yet the fact that it was d at all, even for such a short on, is truly a great triumph of science. The pressure was the of the clash of two plates, one of was accelerated "to the speed of k."

riting in *Literaturnaya Gazeta* of successes with *Sputniki* and . T. Trifonova makes an admis- are for Russian propagandists: who does not know that on the o these triumphs there had been difficulties, bitter failures . . . es of despair . . ." This is a direct diction of the frequent assertions onid Sedov and other Russian experts that their *Sputniki* were ed on the very first tries, with tely no failures ever marring 's rocketry progress.

"Steam Moves a Rocket" is the title of a brief article in *Sovetskaya Aviatsia,* which comments on the latest researches and experiments of using "ordinary water vapor instead of products of burning fuel for rockets." The article is accompanied by a diagram evidently adapted from a West German source, as the Russian author remarks that "West German military experts, feverishly working on their job of equipping the re-emerging Wehrmacht, predict a bright future for this inexpensive motive power" in rocketry.

The diagram and text in the Moscow publication describe the steam rocket engine as a vessel made of steel, by its appearance resembling a large balloon with compressed air. It has a widening nozzle with a faucet that can be turned on and off. The steel container is filled with water to three-quarters of its capacity.

The water is heated to a high temperature with the aid of oil burners or electricity. In this water-heating process the pressure in the chamber rises to 40 or 50 atmospheres. At this point the faucet is turned open, and the hot water rushes into the nozzle. As the water flows out it evaporates with tremendous force. The speed of the vapor stream is considerable. Thus comes the jet power to move the rocket.

It is true, the Soviet commentator adds, that this rocket energy lasts less than one minute, since the vapor pressure in the steel container falls rapidly. But with a steel container holding 500 kilograms of heated water, the very first 10 seconds will give the rocket a respectable momentum. The entire weight of such a steam-powered rocket engine, together with its water, does not exceed 800 kilograms.

A new type of star accumulations or galactics was announced in Moscow as a recent discovery by the staff of the Burakan Astrophysical Laboratory in Soviet Armenia headed by the famous astronomer Victor Ambartsumian. He named them "Non-Stationary" or "Azure Blue." A considerable part of them is gas, out of which apparently new stars are now being formed. Because of this initial stage of star formation, physical processes occur in these "Azure Blue Galactics" far more intensively than in all of the already known constellations.

Professor Ambartsumian says that a thorough study of the Azure Blue Galactics should show new physical phenomena and qualities of matter.

AF Contractors' Backlog Now Totals $7.191 Billion

Backlogs of principal Air Force contractors as of March 1, 1959, totalled $7.191 billion. Twenty-four companies are involved representing approximately 75 percent of Air Force procurement funds. Breakdown in millions, including both missiles and aircraft and covering engines and electronics equipment: A-C Spark Plug, $43.8; Aerojet General, $33.1; Allison Division, General Motors, $96.1; American Bosch ARMA, $53.7; Avco, $24.2; Bendix Aviation, $32.8; Boeing Aircraft, Seattle, $839.5, Wichita, $592.8; Burroughs, Detroit, $80, Paoli, Pa., $11; Convair, Fort Worth, $554.3; Astronautics Division, San Diego, $108.6, San Diego, $371.3.

Douglas Aircraft, Long Beach, $286.6, Tulsa, $27.7; Ford Motor, Aircraft Engine Division, Chicago, $26.9; General Electric, Evendale, Ohio, $179, Philadelphia, $53.3, Syracuse, $158.2, Gas Turbine Division, Utica, $73.9; Hughes Aircraft, Culver City, $232.7, Tucson, $137.6; International Business Machines: Kingston, N.Y., $216.5, Owego, N.Y., $64.2.

Lockheed Aircraft, Burbank, $191.7, Marietta, Ga., $224.5, Sunnyvale, Calif., $13.8; Martin Co.: Baltimore, $110.4, Denver, $58.2; McDonnell Aircraft, St. Louis, $448.1; North American Aviation, $458.1; Northrop Aircraft, Inc., Hawthorne, Calif., $209.9; Pratt & Whitney, Hartford, $566.1; Radio Corp. of America, Camden, N.J., $214.2; Republic Aviation, Farmingdale, N.Y., $239.0; Sperry Gyroscope Co., Division of Sperry Rand, Long Island, $88.7; Western Electric, $79.5.

The Senate Space Committee has okayed a $485.3 million authorization bill for NASA. This is $4.7 million more than approved by the House for space R&D and hardware.

Zeus' Breakthrough

Breakthrough is claimed in the solid propellant motor for *Nike-Zeus* antimissile missile with the development of extremely thin casing walls, a new high-energy propellant and plastic nozzle. Joint effort of Douglas Aircraft and Grand Central Rocket Co. produced a full-scale tactical motor designed for *Nike-Zeus* sustainer which performed perfectly with the series of new improvements.

Sensor to control missile fueling is being placed in production by Pioneer-Central Division of Bendix Aviation. The company says the instrument to detect any change from liquid to gas or vice-versa will be used in *Titan* support and an evaluation order has been received from Convair for use on *Atlas* fueling system.

Air Force Office of Scientific Research is planning to build late this year a hypersonic wind tunnel at the University of California. Tunnel will be used to pursue investigation of re-entry problems, ion propulsion R&D and high-temperature research.

Follow-on $15 million contract for additional production of the 20-foot truck-launched *Lacrosse* surface-to-surface missile has been awarded Martin-Orlando by the Army. This makes $25 million contracted for the artillery-type weapon since January. Two battalions are to be equipped with *Lacrosse* at Ft. Sill, Okla., before the end of this month.

Sound Assaulted

New assault on the effects of sound energy—believed to be the cause of many missile and rocket failures—will be attempted with a new acoustic high-energy generator which theoretically could shred a human brain in 30 seconds. The $100,000 generator produced by Transducers Inc. will be used for testing components by the Autonetics Division of North American Aviation. Reportedly the device can actually simulate the sounds encountered under normal service operating conditions. Horn section is exponential acoustic impedance matching device with more than 100 50-watt high and low frequency drivers. Transducers for high and low frequency drivers are powered by 3500 watt amplifiers, each capable of peaking at 10,000 watts.

HM11XA is first die-castable alloy (1% thorium, 1% manganese and the balance magnesium) to be developed for service above 500°F, according to Dow Chemical. The company reports the new alloy, which has density of 0.064 pounds per cubic inch, also retains good mechanical properties through 800°F.

BMEWS Facility

Domed facility 15 stories high to checkout BMEWS radar and computers is being built near Moorestown, N. within sight of the New Jersey T pike by RCA, prime contractor fo missile warning system. Tower porting antenna and radome wil constructed on pylons descending dependently through the base buil and anchored in an octagonal slab feet wide and 8-feet thick. This meet extreme accuracy requireme tracking equipment which must re unaffected by wind, snow, ice or shi of the building.

Flight testing is under way of tronic Specialty Co.'s low-cost *P* proximity fuse. All weather evalu is being conducted under $93,000 tract with AF Special Weapons Ce Kirtland AFB, N.M. The company mates armed services will spend million in next five years on electr proximity fusing.

Ivar C. Petersen, formerly dir of technical services for Aeros Industries Association, has gone Boeing. After leaving AIA he wa volved in unsuccessful attempt to a ground support association.

EIA estimates authorizations thr FY 1970 for the space market total over $14 billion with electr getting 33% or $4.8 billion. N funding, EIA says, may hit $2 bi a year by 1970.

Astrodyne Development

Astrodyne Inc. reports develop for Navy of low-cost, lightweigh sulator for solid-fueled rocket mo Composed of rubber and asbestos, material has resulted in successful firings with significant thrust level durations of over 3½ minutes. Ext casing temperature was held to 2 for that period while motor wa hausting 5500°F flame.

Canada's Department of De Production has awarded a ceramic neering study contract to Titania tric Corp. of Canada, a subsidia Gulton Industries Inc., Metuchen, Study will be directed at electroni nuclear applications.

Schlumberger Ltd., which ha quired an 80% stock interest in puter Systems Inc., New York plans to invest $3 million in expa CS. . . . Hycon Eastern Inc., bridge, Mass., has switched its na Hermes Electronics Co.

propulsion engineering

New liquid hydrogen plant . . .

at Palm Beach, Fla., is huge—one of the largest industrial gas plants ever built. The facility, which Lt. Gen. Bernard A. Schriever says turns out the "purest hydrogen ever made" has a compressor building six stories high and a quarter of a mile long. Data for the rest of the plant, operated by Air Products, is classified. Schriever told the Institute of Aeronautical Science and the Air Force Academy Cadet Engineering Society meeting at Colorado Springs that the plant is turning out liquid hydrogen in "large tonnage" quantities, thanks to a scientific breakthrough.

This "breakthrough" is not really new . . .

and has been reported twice in this column—March 30, April 6. It is the National Bureau of Standards process for converting unstable orthohydrogen to stable para-hydrogen. Liquid hydrogen ortho molecules naturally want to convert to the para form. The conversion releases considerable heat which constantly vaporizes the liquid hydrogen. This is why liquid hydrogen is so difficult to store and generally calls for recycling refrigerating equipment. The NBS found a way—based on hydrous ferric oxide as a catalyst—to speed up the natural conversion. The technique results in 95% conversion. Since the para-hydrogen is stable, no further heat is evolved and it's possible to store liquid hydrogen in much the same way LOX is stored.

ARDC and Air Materiel Command took over the Bureau of Standards technique and awarded contracts for development of practical, large-scale equipment to Air Products and Stearns-Roger Mfg. Co., Bakersfield, Calif. Each company built small development facilities, and Air Products designed and built the Florida plant.

Development time was remarkably short. The NBS Cryogenic Engineering Laboratory, Boulder, Colo., announced its conversion process only last year, and the Air Products plant was turning out liquid hydrogen last month.

Liquid hydrogen—LOX . . .

propellant system offers 40% more thrust than best present propellants. H_2O_2 will be used in Convair *Centaur* second stage, which has a Pratt & Whitney engine.

Ozone-hydrogen is next . . .

on the list of propellants. Work is progressing in this field, much of it under the direction of Dr. A. V. Grosse, Temple University Research Institute, Philadelphia. Grosse and A. G. Streng recently determined the density of solid ozone, the first time this has been done. Their value, at 77.4°K, is 1.728 grams/cubic centimeter. The liquid density at the same temperature (77.4°K is the melting point-freezing point of O_3) is 1.614 g/cm³. Thus, expansion on melting is 7.1%.

Density of solid ozone had not been measured before because of its ability to detonate at the slightest provocation," Streng and Grosse report in the *Journal of the American Chemical Society*. Their biggest problem was in devising adequate safety measures. Once the pure ozone was frozen into cylinders, it was fairly easy, they say, to measure the length and compute the density.

High-intensity arcs and plasma jets . . .

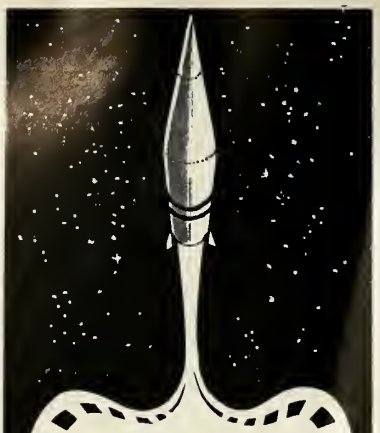
est Carborundum Company's high-temperature ceramics. C. E. Shulze of Carborundum's Research and Development Division, Niagara Falls, N.Y., says the free-burning high intensity arc and the plasma jet (Propulsion Engineering, March 30) have been extremely helpful in development of ceramic composition for high-temperature use.

Specimen surface temperatures above 5000°F are reached in only about 30 seconds of testing, Shulze told the Philadelphia meeting of the Electrochemical Society. Test samples are cylinders one-half inch in diameter. They are subjected not only to high temperatures, but also to subsonic and supersonic jet velocities.

THE
PENNSYLVANIA PLAN:
100% financing
for your
new plant

Complete financing for Lease-Purchase of a new plant is available in labor-surplus areas of Pennsylvania through combined efforts of lending institutions, non-profit community organizations and the Pennsylvania Industrial Development Authority. Interest as low as 2%, with deferred amortization, can be applied on up to one-half of total plant cost.

100% financing is also available in other areas of the State, provided by community organizations, banks, insurance companies and other sources. You select the community you want. You specify plant construction details or choose one of several plant "shells" now being readied for completion.



100% Financing at a Glance . . . Industrial Plant Construction Costs—

Subscribed by local non-profit community sponsored builder-owner corporations.	*20%*
2nd Mortgage Loan, Pennsylvania Industrial Development Authority.	*30%*
1st Mortgage Loan obtained from banks, insurance companies and similar lending institutions.	*50%*
Total financing, secured through local subscriptions and mortgage loans, without cash investment by the manufacturer.	*100%*

For free copy of "Plant Location Services" pamphlet, or for details on 100% financing, write or call:

Pennsylvania Department of Commerce

missile business...

By WILLIAM E. HOWARD

Along Wall Street and its backwaters, financial men appear to be getting more and more wary of the "glamor" stocks—fast-moving shares of missile/aircraft, space and electronics companies. Ask almost any stock broker what he thinks of the missile industry issues, and more than likely the answer will come back: "overpriced, I guess, maybe . . . maybe not."

How can any stock selling at 70 to 80 times earnings . . . be worth it? Just a few years ago many brokers were loath to recommend stocks selling at 30 times earnings. Is the stock market now moving into an entirely new era? Or will there be a sharp downturn and a reversion to the old standards? You can get as many different answers to these questions as you can find experts.

Monopsomy is a word bandied about . . . of late in the money marts. One broker defines it as describing an economic condition where there are many sellers—and one buyer. The missile industry and the Government. On one hand monopsomy may hold a degree of security in that weapon contracts are large and payment is certain. But, on the other hand, contracts are subject to cancellation and the Renegotiation Act and the profits can be small. Competition is keen.

Accordingly, the watchword of many investment dealers on missile stocks is caution. They say a "shake out" of the industry is bound to come—a "shake out" in which some big companies now in the field may wind up small as far as missiles are concerned. While some experts concede upward revision may be in order for the earnings-price ratio, they point out that stock prices have been helped to new highs by a relative scarcity of stock compared to public demand.

Predicting the "market could break anytime" . . . the vice president of a mutual fund management firm said recently his investment trusts are cashing in their profits and investing in blue chips. "In our opinion (missile stock) prices have reached levels completely unrealistic to their true worth because of wild speculation by the public," said William S. Palmer of Templeton Debbrow & Vance.

Could the public be right . . . are worries unjustified? Taking a long look into the future, Walter K. Gutman of Shields & Co. investment house, says it is possible that modern technology can bring about a "complete economic solution" for all the people of the world by 2000 or shortly after. The 1929 crash was a disaster in his opinion which has become a "neurotic fixation with us." At that time, Gutman says, the market was saying something big and may be saying something equally big today—because the huge industrial output and profits 1929 speculators dreamed about have come to pass "and even more than they dreamed."

In a few years today's prices . . . may seem "very conservative," says the optimistic stock broker. "The stock market is far from ahead of our true industrial potential." And Gutman believes this will be borne out after 1960.

And he sounds another cheery note . . . "Perhaps there will be several sorts of disaster between now and the year 2000—but if these disasters do not occur . . . if year by year we find the vision becoming more real . . . then we will have to recognize that the stock market of 1957-59 was seeing truly—not giddily.

"It was not drunk, just enthusiastic."

William A. M. Burden, New York financier and aviation consultant, has been elected chairman of the board of trustees of the Institute for Defense Analyses.

BURDEN

The Institute is a non-profit corporation formed in 1956 at the request of the White House nalyze and evaluate the nation's de- systems and provide other technical ices to the Executive Office of the ident, the Secretary of Defense and t Chiefs of Staff.

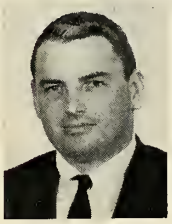
Burden recently won unanimous ap- al from the Senate Space Committee it on the National Aeronautics & e Council. He is also a director of Council on Foreign Relations, a di- or of the Hanover Bank, Cerro de o Corp. and other companies.

Varo Mfg. Co. Inc.'s new division, owave Power Laboratory, will be ed by **Jack G. Smith,** vice president- neering. This division will exploit epts and applications of very high owave power outside the radar and munications fields.

William A. Mussen, former chairman of Southwest Research Institute's Electrical Engineering Department, was named chief development engineer for the Singer-Bridgeport facility of the Singer Military Products Division, and will be in charge of military n and development projects. At hwest Research, Mussen maintained hical and administrative control over rical engineering activities from 1955 gh 1959.

MUSSEN

red W. Trebes has been appointed general manager of Hydromatics, Inc's. Pacific Division. Trebes was engineering group leader on control valves for the Rocketdyne Division of North American Aviation, Inc. He was formerly in power plant engineering for North- Aircraft, and later for Douglas Air-



TREBES

r. Winfield W. Salisbury, who has appointed technical director of the on, is known for his pioneering efforts in high power RF sources starting with cyclotron development at University of California in 1937. **Dr. Fred L. Whipple,** Director, Astrophysical Observatory, Smithsonian Institution, will act as consultant.

The staff will be expanded to 150, of which 50 will be physicists and engineers. Several new facilities will be required.

Two men have been appointed to management positions for the Missile Development Laboratory of Minneapolis-Honeywell Regulator Co., as part of a staff expansion program. **Kenneth H. DeRoche,** 34, of the sales engineering and administration departments, has been named contract manager.

Samuel H. Cantwell, 30, named manager of administration, has been employed by the company's Aeronautical Division for five years in the personnel and contract management departments. He is a graduate of Harvard University.

CANTWELL

Harold S. Geneen has resigned as executive vice president of the Raytheon Manufacturing Company to become president of the International Telephone and Telegraph Corp. Geneen joined Raytheon in 1956 from the Jones and Laughlin Steel Corp., where he had been vice president and controller. Prior to that he served for four years with the Bell and Howell Co.

Thomas H. Evans has become controller of Servomechanisms, Inc. He had been serving the accounting firm of Ernst & Ernst as consultant analyzing Servomechanisms, operational requirements. He will now be responsible for the company's dealing with governmental agencies on financial affairs.

EVANS

William L. Reynolds recently submitted his resignation to Electronic Industries Association to accept the position of general attorney of Litton Industries, Inc. Before joining EIA in 1953 as staff attorney, Reynolds was an associate in the Washington law firm of Covington & Burling. He was named assistant general counsel of EIA in 1956 and elected by the Board of Directors in 1957 to succeed **Glen McDaniel** as general counsel of the Association.

Edmund G. Shower was appointed to the new position of production engineering manager for the Sperry Semiconductor Division, Sperry Rand Corp. He will direct the development, design and construction of new facilities and equipment for volume production of silicon transistors, diodes, and rectifiers.

SHOWER

The Senate has confirmed the nominations of **William A. M. Burden** of New York (see above) and **Dr. John T. Rettaliata** of Illinois to be members of the National Aeronautics and Space Council. Both were endorsed unanimously by the Senate Space Committee.

William F. Hafstrom was appointed assistant to Bendix Aviation Corp. vice president and group executive **E. K. Foster.** In his new capacity, Hafstrom will work directly with the management officials of Bendix Radio Div., York Div. and Cincinnati Div., the three divisions for which the vice president is responsible.

It has been announced that a long-time employe of Avco's Crosley Division, **A. J. Verax,** has become manager of its Cincinnati plant. Verax was Crosley's director of purchasing. **R. B. Megrue,** who has divided his efforts as plant manager between Crosley's Evendale and Cincinnati facilities, now will devote his full attention to the Evendale plant. Verax joined the Crosley Division in 1946 and since that time has been associated with the Division's Purchasing Department. He first was employed as a follow-up man, then successively became a buyer, project leader, manager of defense procurement, senior buyer, purchasing agent for commercial products, and, in July of last year, director of purchasing.

VERAX

Robert E. Gross, chairman of the board of Lockheed Aircraft Corp., and **Donald H. Douglas,** chairman of the board of Douglas Aircraft Co., were co-winners of the California Industrialist of the Year Award, presented by the California Museum of Science and Industry.

Gross was recognized for leading Lockheed's development of the new jet prop Electra and achieving success in a space program including system management of *Polaris* and the *Discoverer* series.

Douglas was honored for directing development of the DC8 jet passenger transport and the *Thor* IRBM.

LITES Suggested

To the Editor:

In a recent article by Major William C. Mannix, USAF, and an editorial—both in the April 27th issue of M/R, an appeal was made to the "scientific community" for some method of standardizing velocity terms and units.

Major Mannix suggests the use of the word "Optik" until something better could be applied. He also requested the reader to let him know if a better word could be applied for the unit.

My suggestion, strictly from a layman's point of view and without taxing a scientific mind is the word LITES—which is derived from Light In Thousandths of Energy Seconds—or 1 LITE equals 186 mps.

Major Mannix is to be highly complimented on his article—a text well within the reach of the average mind. Too many "brains" today try to talk as far above the average citizen as the intersteller space that they are speaking of.

A special bit of praise should also go to the Missiles and Rockets editorial staff for a magazine unexcelled in its field.

F. A. Fleckenstein,
Engineering Analyst,
Cleveland Ordnance Plant,
Cadillac Motor Car Division

Moon Trolley

To the Editor:

Undoubtedly the task of keeping up with all the latest developments in missile and space projects keeps you extremely busy, but you may find that the following epochal communication will be of interest to scientists and engineers engaged in research and development on the ways and means of space travel. Our group, which is occupied with less esoteric problems, reads your magazine avidly and, indeed, considers it a "must" to be well-informed in the field. However, we feel that coverage of events will be incomplete without the addition of the plan outlined below.

After deciding during one of our recent coffee breaks to solve some pressing problems confronting the world today, we have come up with a practical, relatively inexpensive means of shuttling men and materials to the moon and back. Once instituted, our plan will enable diversion of the astronomical sums of money now being spent for rocket ships into other channels.

Since the moon always presents the same face to the earth a cable, securely anchored to the moon's surface, could be stretched to within 20 miles of the earth's surface. The earth end of the cable will simply be left hanging, free to circle the earth as it is pulled around by the moon. The moon's orbit is not quite circular, therefore the distance from the surface of the earth to the free end of the cable will vary somewhat and should be sufficiently great to prevent the cable from scraping on mountains.

Most of the cable's mass will lie wit in the earth's gravitational influence a will therefore try to fall to earth; ho ever, since its earthward movement constrained by being anchored to t moon, the net result will be to keep t cable taut. The farther away from t earth and moon the cable is, the less w be the gravitational attraction on t cable. Therefore, the cable possesses ma but relatively little weight along mo of its length. This property will help prevent the cable from failing in tensio

Next, we attach a cable car to t cable, and use the car to climb the cab until it reaches the gravitational influen of the other body, either moon or ear depending upon direction of travel, which point the car will start to desce the cable. The car will be kept at a re sonable speed by braking during desce to the surface of the attracting body.

Shuttle rocket planes will be used ferry men and materials to the cable c at the earth's end to which a passeng terminal and observation platform wou be attached for convenience of waiti passengers.

We have not worked out minor d tails such as size of cable necessary, a lowable car speeds, etc., but perhaps sor of our mathematically-inclined frien may be interested in working out the problems.

Obviously this solution will not wo for travel between planets because of t variations in orbits, but we expect to wo on that problem in future coffee breal

Francis A. Handville
Raymond F. Pohl
Picatinny Arsenal
Dover, New Jersey

P.S. The coffee contains nothing mo than cream and/or sugar.

Hardeman Participating

To the Editor:

Paul Hardeman, Inc., is proud of participation in the design and constru tion of missile test and launching facilitie To date we have participated in over major projects of this nature. We a particularly enthusiastic about our late participation in the *Titan* program throu the start of construction of the first ni operational complexes at Lowry Air For Base, Colorado.

We were distressed, therefore, to fi our name missing from the list of o joint venture partners on page 45 of t May 11 issue of MISSILES AND ROCKET The correct information is as follows:

Morrison-Knudsen Company; Pa Hardeman, Inc.; F. E. Young Constructio Co.; Johnson, Drake & Piper, Inc.; Olso Construction Co. have been awarded contract for the construction of W 107A-2 technical facilities, Lowry A Force Base, Denver.

Morrison-Knudsen Company is th sponsor of the joint venture and Pa Hardeman, Inc., and personnel will be a substantial share of the responsibility.

Patrick R. Black,
Vice President, Engineerin

We regret the omission . . . Ed.

WASHINGTON—The Department of fense has announced that it awarded otal of $213,400,000 in contracts **Lockheed Aircraft Corp.,** for work military satellites. The amounts had been disclosed previously. $96,-),000 applies to Project *Sentry,* an erimental satellite designed to size enemy installations with camera ipment. $106,000,000 was awarded to April 30 for experimental *Dis-erer* satellites, closely tied in with *Sentry*. $10,800,000 is allocated to ject *Midas,* the experimental satel- being designed to warn against my missile attacks.

NASA

4,805—**Avion Div. of ACF Indus-tries, Inc.,** Parmus, N.J., for pro-duction of transistorized electronic devices for the Project *Mercury* capsule (subcontract by Collins Radio Co.).

NAVY

557,000—**Aratz Contracting Co.,** San Francisco, for guided missile support facilities at the Naval Am-munition Depot, Concord, Calif.

$0,000—**Perkin-Elmer Corporation,** Norwalk, Conn., for design and construction of a 36" aperture tele-scope to be used in high-altitude photography of planets and celes-tial bodies (subcontract by Prince-ton University).

€,631—**Thompson Ramo Wooldridge Inc.,** Cleveland, for labor, facilities and material to manufacture *Side-winder* 1-0 motor tubes.

AIR FORCE

$2,500,000—**The Crosley Div. of Avco Corp.,** for radar equipment. Many items to be sub-contracted o other companies.

$1,000,000—**Western Electric Co., Defense Projects Div.,** for design and installation of a communica-ions network in support of AF facilities in the Aleutians. **Bell Tele-phone Laboratories** will participate with 50% of the work being sub-contracted.

$2,00,000—**Vitro Engineering Co.,** for operation and maintenance of power facilities on SAGE-*Bomarc* bases.

$2,00,000—**Astrodyne, Inc.,** Mc-Gregor, Tex., for research, de-velopment and testing of large-scale rocket motors and new high-energy solid propellants. Included is 188,000 for the manufacture of *Aegaboom* solid propellant rocket motors for Holloman AFB.

$400,000—**The Siegler Corp., Halla-more Electronics Div.,** Denver, for development and installation of photo optical, film camera and closed circuit TV systems used with the *Titan* missile. **The Martin Co.** is the prime contractor.

$251,300—**Philco Corp.,** Philadelphia, for technical services (two con-tracts).

$100,000—**The Johns Hopkins Uni-versity,** Baltimore, for research on design, development and operation of instrumentation to make auroral spectral measurements from rockets, balloons or satellites.

$93,000—**Electronic Specialty Co.,** Los Angeles, for testing of its new low-cost Panda proximity fuse.

$53,500—**The University of Michigan,** Ann Arbor, for research and study of rocket measurements of aero-dynamic quantities.

$52,000—**Stanford University**—Stan-ford, Calif., for research and in-vestigation of the current flow of plasmas.

$50,000—**Stanford Research Institute,** Menlo Park, Calif., for research on phenomena related to high-speed impact of particles with gases.

$31,187—**Oklahoma State University of Agriculture & Applied Science, Research Foundation,** Stillwater, for design, development and construc-tion of meteoritic microphone de-tectors of various sensitivities for use in satellites.

$25,450—**Massachusetts Institute of Technology,** for research and de-velopment for determination of heats of formation, heats of fusion and heat capacities of compounds of magnesium with Group IVb elements.

The Budd Company, Philadelphia, has announced that they have been awarded a contract by the **Utah Div. of Thiokol Chemical Corp.,** for construction of solid-propellant rocket engine cases for the *Minute-man* ICBM (amount not disclosed).

ARMY

$15,181,000—**The Martin Co.,** Balti-more, for additional production of *Lacrosse* artillery missiles. (Total amount contracted for this weapon $25,181,000.)

$3,024,735—**Ray M. Lee Company,** Atlanta, for building construction at Redstone Arsenal.

$2,757,897—**Blount Brothers Construc-tion Co.,** Montgomery, Ala., for construction of *Bomarc* facilities in-cluding all related work at Raco Auxiliary Field, Raco, Mich.

$2,669,250—**Blow Knox Company,** Pittsburgh, Pa., for 20 sets of pro-pellant loading skid assemblies.

$2,320,567—**California Institute of Technology,** Pasadena, for research and development on the *Sergeant* missile program. Work to be done at the Jet Propulsion Laboratory in Pasadena.

$2,000,000—**Raytheon Mfg. Co.,** Wal-tham, Mass., for engineering serv-ices on the *Hawk* missile. This prime contractor invites sub-con-tractors in NE for drafting services, specs writing and technical manual preparation.

$807,642—**Ashburn & Gray, Inc.,** Huntsville, Ala., for site prepara-tion for missile systems test facility for solid propellants at Redstone Arsenal.

$238,962—**C. H. Leavell & Co.,** El Paso, Tex., for modifications and additions to existing launching areas at White Sands Missile Range.

$99,638—**M. Steinthal & Co., Inc., Aeronautical Equipment Research Corp., Div.,** N. Y., for design, de-velopment, fabrication and test parachute recovery system for the *Redstone* booster.

$43,712—**Yale University,** New Haven, Conn., for research study of theo-retical nuclear physics.

$39,557—**Harvey Aluminum, Inc.,** Tor-rance, Calif., for production engi-neering.

$37,250—**Beckman/Berkley Div.,** Rich-mond, Calif., for computer analog.

$34,000—**C. H. Wheeler Mfg. Co.,** Philadelphia, for two items of single stage, double suction volume, horizontal split case pumps.

$32,952—**Potter Aeronautical Corp.,** Union, N.J., for six items of tur-bine type flow-meters.

$32,920—**Redel Engineering Corp.,** Pasadena, for generators and amp-lifiers.

$32,175—**Olin Mathieson Chemical Corp.,** East Alton, Ill., for research and development of missile com-ponents by use of explosive media.

$27,965—**Consolidated Electrody-namics Corp.,** Pasadena, Calif., for two 36-channel oscillographs.

Lycoming Div., Avco Corp., has been awarded a contract for develop-ment and delivery of AC-DC power systems incorporating a mechanical constant speed drive for the AN/-USD-4 *Swallow* surveillance drone. **Republic Aviation Corp.,** Farming-dale, L.I., is the prime contractor. (Amount not disclosed.)

CASE HISTORIES

Frequency Time Standard instruments, selected by Smithsanian Institute ta clock satellites, are equipped with New Departure ultra-precise ball bearings.

Photos: Courtesy Ernst Norman Laboratories and Bodine Electric Co.

Ultra Precise Ball Bearings Help "Clock" A Satellite!

CUSTOMER PROBLEM:

Require ultra-precise bearing design for Bodine electric motor used in satellite-tracking micro-clock. Bearings must provide uniformly low starting torque, precise location of rotor shaft and minimum maintenance, to help mechanism achieve time determinations to 0.001 second.

SOLUTION:

N/D Sales Engineers studied special bearing requirements, and recommended New Departure ultra-precise ball bearings. These ball bearings measured up to every requirement for micro-clock motors . . . thanks to New Departure's advanced equipment for research, development and production. N/D equipped micro-clocks, selected by the Smithsonian Institute, are operating in a dozen locations around the world right now, keeping track of vital satellite movements . . . to accuracies of one millisecond and better!

If you're manufacturing or designing electric motors for any high precision applications, including instruments, why not call on New Departure? N/D engineering and research facilities are turning out the latest in high precision instrument ball bearings and advanced ball bearing designs. For more information write Department K-6.

Reaction Motors—America's first rocket company and an outstanding pioneer in the field of liquid propellant rocket engines—now, a part of Thiokol Chemical Corporation, is contributing important advances in rocket engineering. Developing power plants for the Air Force's X-15 manned rocket plant is one of the current projects. With the addition of Reaction Motors Division's experienced personnel and modern facilities, Thiokol has expanded its leadership in the design, development and production of rocket propulsion systems to both solid and liquid rocket engines.
Engineers, scientists—perhaps there's a place for you in Thiokol's expanding organization. Our new projects present challenging problems and the chance for greater responsibility.

INSTANT
INDICATION OF VOLTAGE TOLERANCE

with the NLS 50 Go/No-Go Voltage Comparator

Here's a new method for determining whether or not an input voltage is within prescribed limits . . . and to do so quickly, easily and accurately! Just set the front panel dials of the NLS 50 Voltage Comparator to read any two voltages within the range of ± 0.001 to ± 999.9 volts. Apply the voltage under test and in 90 milliseconds the NLS 50 gives a clear go/no-go indication of voltage tolerance. Watch the limit lamps on the front panel. If the green "Between Limits" lamp lights, the applied voltage lies within the pre-set limits. If either of the red lamps light — "Upper Limit" or "Lower Limit"—the voltage under test is too high or too low.

With a sensitivity of 0.005% and its limit settings precise to ± 0.01%, the NLS 50 Voltage Comparator outperforms any other type of voltage limit detector. It's transistorized, too . . . for reliability and ruggedness. And it's so compact . . . the only limit detector complete in one package. Comparison amplifier, limit setters, reference supplies and range multiplier are all included in the one instrument, a 3½-in. high unit that fits conveniently into a standard 19-in. rack.

In addition to giving visual warning to the operator, the NLS 50 gives go/no-go commands to such electrical devices as cut-off relays, sorting chutes, data printers, tape or card punches, and audible warning equipment. Extremely versa tile, the instrument may be used as a high-accuracy voltmete without modification and may be adapted easily to detec resistance limits.

The broad applications of the NLS 50 Voltage Comparato include the following:

- Automatic checkout of missiles and electronic systems.
- High-speed, high-accuracy warning systems involving an parameter that can be converted to voltage (speed, tem perature, liquid level, distance, angle, acceleration, mag netism, weight, pressure, flow, light or other radiatio flux).
- Automatic component test equipment for testing resistor relays, diodes, transistors, vacuum tubes, batteries, tachom eters, motors, speed regulators and slip rings.
- Automatic process control, receiving inspection, produc tion quality control.

Write today for more detailed information concerning th capabilities, applications and operation of the new NLS 5 Go/No-Go Voltage Comparator.

Foresight with a **wallop!**

Foresight which saw the coming of the Space-and-Missile Age enabled Goodyear Aircraft Corporation to begin construction—*more than ten years ago*—of what is today one of the most advanced and largest integrated rocket engine case facilities in the nation.

Furnaces—among the largest ever built for the task—spawn these exacting space-conquering units. Experienced technicians, backed by batteries of test equipment, control the quality of the materials—insure the soundness of each weld—maintain tolerances to thousandths of an inch.

This foresight, these skills, this equipment have made Goodyear Aircraft the birthplace of more large-size rocket engine cases than any other producer.

For more information on this completely integrated facility, write Goodyear Aircraft Corporation, Dept. 916PF, Akron 15, Ohio.

UNLIMITED DIGITAL DATA RECORDING WITH DATATAPE SYSTEMS

From isolated monitoring outpost to cramped shipboard quarters at sea, DataTape's two new 5-680 Series Digital Recorder/Reproducers are more than a match for severe environments and critical operating conditions. Sturdy construction, completely transistorized electronics and fungus resistant component materials provide reliable instrumentation of long life.

TYPE 5-681— TAPE SPEEDS RANGE FROM 2 TO 30 IPS. ACCESSORY HINGED DUST COVER COMPLETELY SEALS TRANSPORT WITH A CONTINUOUS GASKET.

TYPE 5-682— TAPE SPEEDS UP TO 150 IPS. VACUUM BUFFER CONTROL OF TAPE LOOP ASSURES SHORT STOP AND START TIMES FROM HIGH SPEED WITHOUT UNDUE STRESSES ON TAPE.

DataTape's 5-681 and 5-682 are available with automatic tape skew correction...parity test circuitry...pulse activated remote control...visual signal monitoring...and remote footage indicator. Other features specified by users can also be incorporated.

The transports fit standard 19″ racks and require only 24½″ of vertical space. They accommodate NARTB reels to 10½″, and special reels are available. Type 5-681 provides 5-millisecond stop and start times and 5-682 operates at 3 milliseconds. Tape positioning accuracy of both units is ±0.05″ in forward or reverse. Start, stop and reverse cycling rates to 100 per second are easily achieved. Speed changes are made by electrical switching of multispeed capstan motors. Operating power requirements are 110 volts, a-c, ±10%, 60 cycles ±1 cps, at 10 amperes.

For complete information, call your nearest CEC sales and service office or write for Bulletin CEC 1618 X-4.

EASY ACCESS—ENTIRE TRANSPORT ASSEMBLY SWINGS OPEN ON STUROY HINGES FOR FULL ACCESS TO ALL COMPONENTS. SPECIALLY DESIGNED REEL MOTORS WITHSTAND INTERNAL TEMPERATURES TO 250°C.

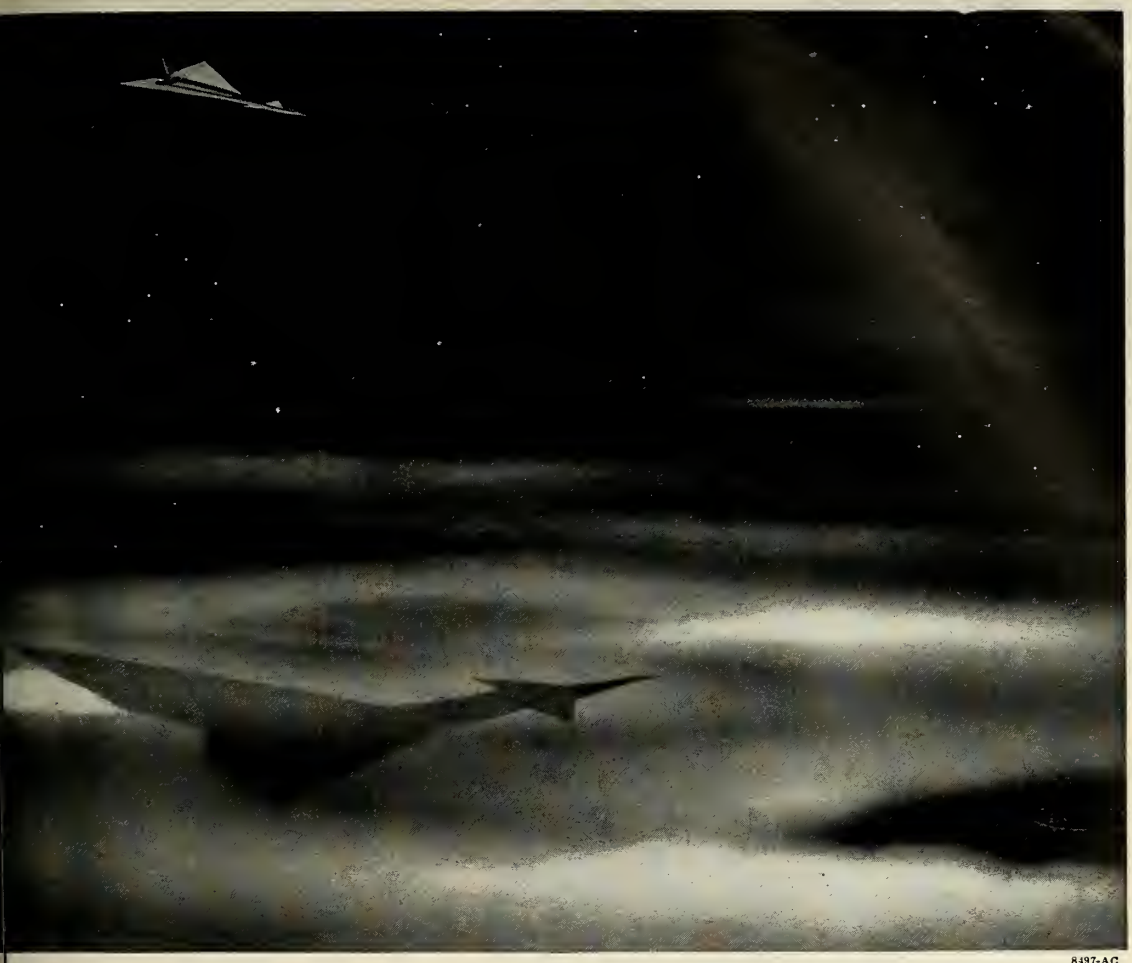
ATLAS GETS A LIFT

ATLAS ERECTOR-LAUNCHER slated for use at operational bases is shown in recent successful test by Convair at San Diego. This type of mechanism will be installed at *Atlas* complexes at Warren AFB, Wyo. Missile with erector-launcher will be enclosed in a concrete building. Stored in horizontal position, missile is quickly raised by a 75-hp motor. After it is erect, the nose cone clamp opens and the boom swings out of the way. Westinghouse produced controls.

BORESIGHT ACCURACY TO 1/15 MILLIRADIAN? SEE BRUNSWICK

Brunswick-built radomes are setting new highs not only for strength-to-weight ratios, but accuracy as well. The reasons for the accuracy are simple: Brunswick has the test facilities and know-how that are without peer in the industry. Three radome ranges which automatically detect boresight error to an accuracy of 1/12 to 1/15 milliradian are now in full operation at Brunswick.



Soon to be in operation: two 1,000-foot ranges, manually operated, that will assure even more refined accuracy, detecting errors as small as 5 seconds of arc. Also, as an aid to design, quality control and maintenance of electrical tolerances, Brunswick is currently utilizing a one-horn interferometer for accurate IPD measurements and corrections before final range testing.

Behind these extensive test facilities operates an engineering team skilled in both detecting and *correcting* boresight error. To learn how this combination of facilities and engineers can give you uniquely accurate, tough and lightweight radomes, write to: Brunswick-Balke Collender Company, Defense Products Division Sales Manager, 1707 Messler St., Muskegon, Michigan

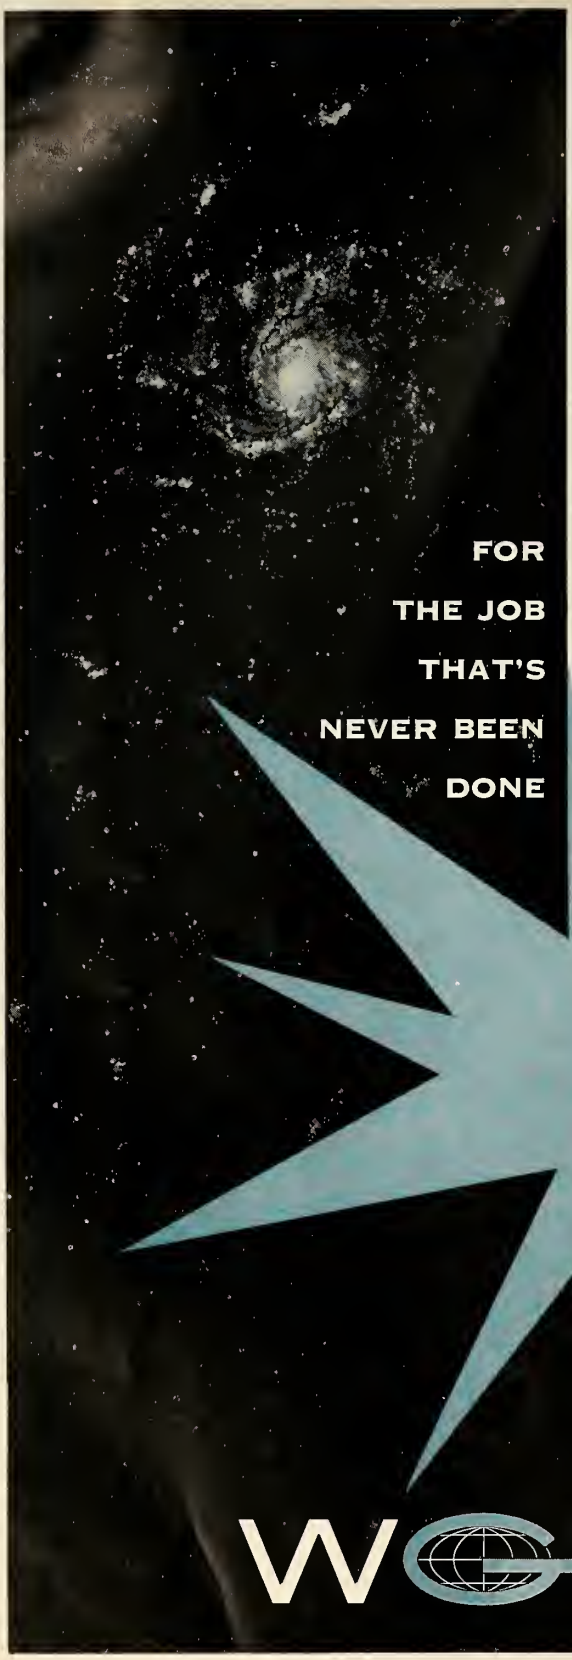
SPECIFICATION: AERONCA BRAZED HONEYCOMB STRUCTURES

DESTINATION: *MACH 3!*

To meet the critical demands of Mach 3 performance, new concepts in air vehicle structures have been evolved. Stainless steel honeycomb sandwiches, for example, are specified as major structural components in current weapons systems designed to operate in high mach environments.



Aeronca, a pioneer in the application of stainless honeycomb to air weapons, has developed advanced production methods and facilities under a proprietary research and development program. As a result, Aeronca is one of the few companies actually producing these high-temperature structures in quantity.

Aeronca is proud that its capabilities have been selected to support the North American B-70 and F-108 Weapons Systems.

in missile propulsion systems and components, ask **WESTERN GEAR**

Western Gear Corporation's research program is carrying its Precision Products Division higher and higher into the field of missile propulsion. Western Gear laboratories are constantly probing into unexplored fields, evaluating and testing materials. Production contributions under prime and sub-contracts in the missile propulsion field include turbo pump drives, thrust chambers, nozzles, jetavators and APU drives.

But research is only the beginning. After the impossible job is resolved in theory, Western Gear throws these factors into the project: 71 years of precision manufacturing; broad experience in electro-electronic and mechanical power transmission equipment; large engineering teams in many fields; outstanding test facilities; Systems Management control and direction; and TOTAL RELIABILITY in product performance.

Are you faced with unusual reliability requirements in a missile propulsion system? Write for full information to:

The New Deputy Secretary of Defense

Early in May, when Thomas S. Gates had resigned his place as Secretary of the Navy and expected to leave public service behind him probably for all time, he sat down and wrote a farewell address. These apparently were not words put together by a speechwriter, but Gates' own thoughts and reflections after some ten years of Government service both in and out of uniform.

He wrote:

"Tonight I am going to let the chips fall. I do so in hope that I can be helpful. I do so as I reach the beachhead of so personal a D-Day."

The talk was delivered to the Navy League and as such was inevitably pointed toward the Navy viewpoint, but the convictions and philosophy of Thomas Gates as an American carry a certain reassurance in their calm tolerance and soundness. He said:

"It is not to banish hope but to achieve realism that we seek to penetrate the clouds that hang low over our country. Peace we hope for and believe in, but it will be an uneasy peace. The basic concepts of communism will not change quickly—if at all. The United States has no thought of varying from the ideals of freedom on which this nation was founded. No true partnership can be built between these directly conflicting philosophies. Temporary arrangements might be made, from time to time, in mutual self-interest, but a partnership requires more substance.

"The struggle between two great power blocs and two great religions of the spirit will stay about as it is for years. The intense effort of trying to convince and win the respect of the uncommitted rising people of many lands will go on and on in extra innings. This we must accept and learn to live with.

"The USSR will continue to probe and test our determination and our will.

"As an essential part of this forecast, we will see an indefinite requirement for strong military services, large defense spending, alert and combat-ready forces in being with which to back up our foreign policy.

"The need will continue and grow for more enlightened American leadership, foreign help to those less fortunate—a need to travel, to see, to talk the languages, to invest, experiment, to gamble and to sell."

Mr. Gates is a Navy man and believes in the Navy, but he had a word of warning which fits the three services equally:

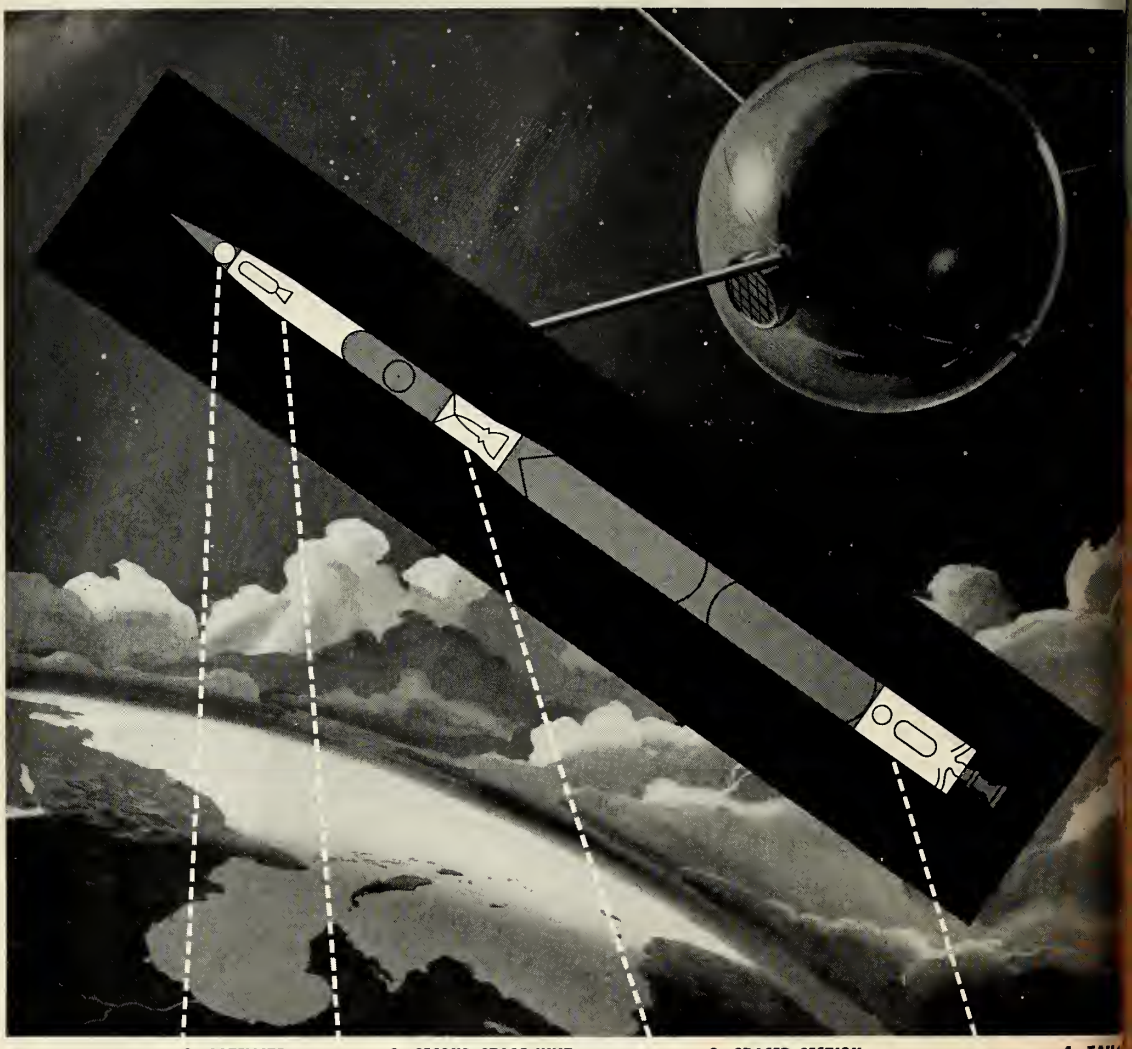
". . . If in our preparation for the future we are influenced by self-interests; if we tend to divide internally into traditional blocs of interest; if we continue to jealously watch the other services and to resist change, it is not going to be a very good destiny.

"For example, we should not focus on differences with the other services, but rather learn from them, help them and work with them. We might even buy some of their strong convictions."

Although agreeing that the horror and destruction of a major nuclear war made such a prospect virtually unthinkable, his words conveyed the thought that we have no alternative but to accept the concept of deterrence. It was, he said, "common sense."

His thoughts on the subject of limited wars revealed his attitude toward the other side of the coin. He said:

"The cold and limited war problem is not simple, but it is vital to understand it. In a limited war situation, the Navy must maintain a capability to use either nuclear or conventional weapons to the controlled degree necessary to achieve the objective. More funds are required for this purpose. More accent on its importance is needed. This support will have to come from the elimination of certain of the very expensive mass-destruction, single-purpose weapon systems which have a priority of claims against our national resources."



In general observation, Mr. Gates said:

"The Joint Chiefs of Staff continue to struggle with divided opinions as to the emphasis to be placed on various systems; and the Secretary of Defense continues to struggle handicapped by traditionally divided service opinions. The kind of constructive, objective teamwork that enabled us to win wars would help him. Again, good sense argues for understanding and agreement. Intelligent answers can be found within the informed minds of the best of our military and civilian officials."

There are few things there that any of the services can quarrel with, and much to give hope of wise judgment in an assignment where the lack of it can be a costly thing. If he can inspire—or create by organization—the kind of teamwork he pleads for, if he can do this alone he will have been successful.

DOW | MAGNESIUM PRODUCTS

1. SATELLITE

The rigid external skin of the weather satellite is made of magnesium alloy, AZ31B. It is plated with gold and other materials to reflect heat.

2. SECOND-STAGE UNIT

The skin is made of HK31A, magnesium-thorium alloy sheet. This elevated temperature alloy must withstand temperatures of 700° F. and above.

3. SPACER SECTION

The skin is formed of AZ31B magnesium alloy sheet. Magnesium was selected for its light weight and high strength-to-weight ratio.

4. TAIL

Again AZ31B magnesium alloy chosen because it is the world's ligh structural metal.

LIGHTWEIGHT MAGNESIUM SPEEDS WEATHER ROCKET FOUR WAYS

The shell of the satellite and several parts of the Vanguard Rocket are made of standard magnesium-aluminum-zinc and magnesium-thorium alloys. Why was magnesium chosen for this project? Because it is the lightest commercially available metal that could be easily fabricated—one with a high strength-to-weight ratio and able to withstand elevated temperatures encountered during flight. Magnesium alloys met these demanding requirements, as pro by tests conducted by the Naval Research Laboratory Washington, D. C.

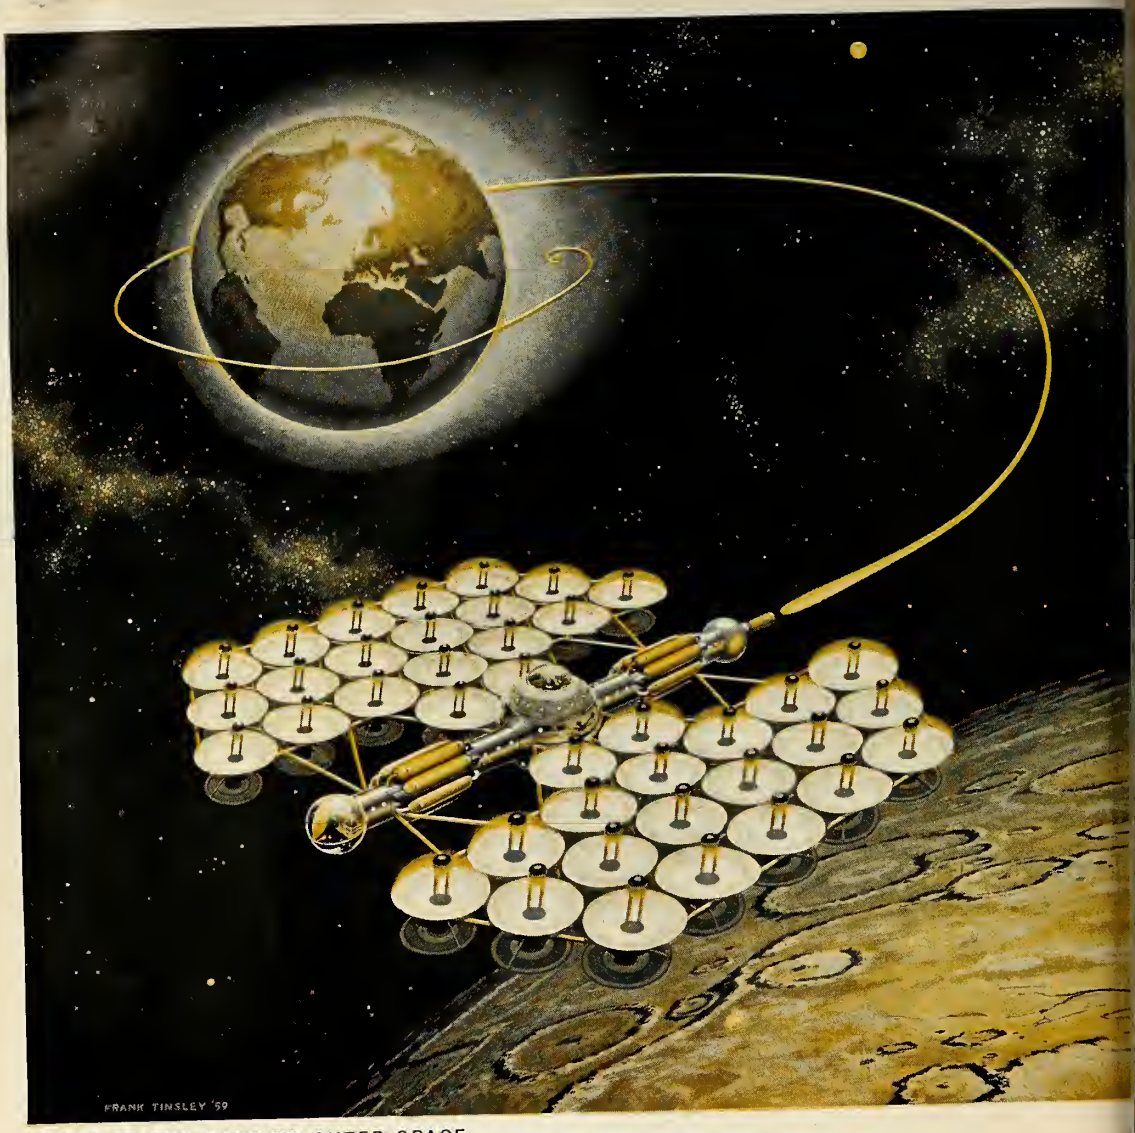
A TALENT FOR WEAPONS TEST EQUIPMENT

AVAILABLE NOW FOR ANY WEAPONS SYSTEM: SCATE—Stromberg-Carlson Automatic Test Equipment

- Completely solid state; modular.
- Punched Mylar tape with photoelectric reader programs tests at rates up to 7,000 bits per second.
- Tests any weapons system, component or sub-assembly.
- Follows weapons system from prototype to operational status.
- Self-checking; self-calibrating.
- Detailed fault location down to the smallest resistor.
- Provides rapid HI-GO-LO and numerical evaluation as well as permanent printed record.
- Reduces cost and time of designing test equipment for each individual requirement . . . because most modules are standard.
- In a typical case, SCATE has reduced a 12-hour manual testing program to less than 5 minutes—a reduction of over 99%.

Today's SCATE system—currently in production for an advanced weapons system—is equally applicable to those of tomorrow.



H. C. Sager, Manager of Sales, is available to discuss your specific application. Literature on request.

STEPS IN THE RACE TO OUTER SPACE

Cosmic Butterfly

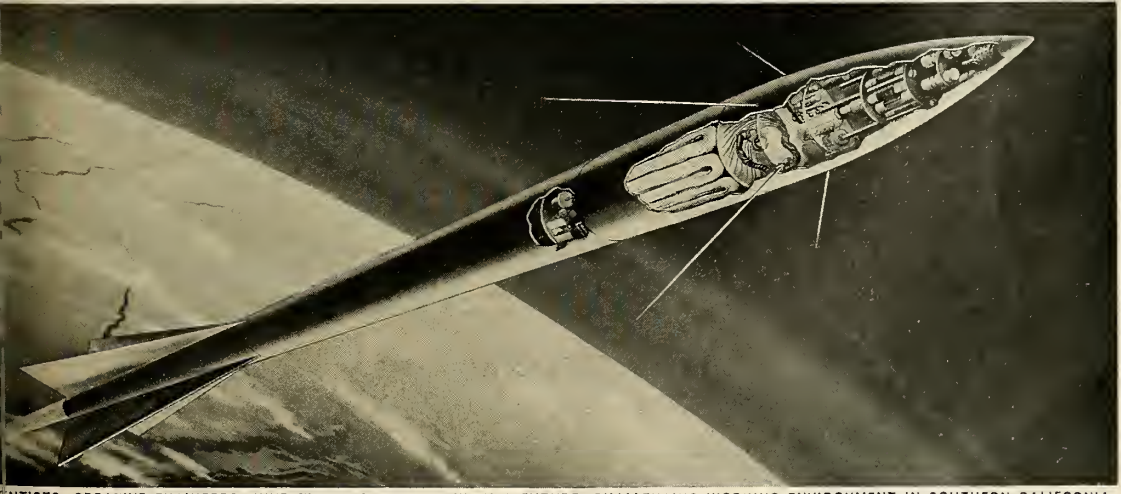
Spreading its wings to absorb the eternal flow of solar energy is the Cosmic Butterfly, a space vehicle of a type first conceived by Dr. Ernst Stuhlinger of Redstone Arsenal.

Each of the fifty-foot parabolic mirrors in the wings concentrates the Sun's rays on a boiler at its focal point. Steam is developed, which drives a 200-kw turbo-generator in the base. Cooled by frigid outer space in heat diffusers, the steam reverts to water and is pumped back to the boiler to be used over and over again.

The current thus generated drives the main propulsion unit, an ion rocket in which powerful electric fields accelerate charged particles, shooting them from the rear of the rocket exactly as the electron gun in your TV set bombards the screen. Sunlight, then, is the power source, whereas cesium is the propellant.

While the recoil thrust is relatively small, the weightless vehicle is operating in a vacuum and the push is enough to enable the Butterfly to reach interplanetary speeds. Unlike conventional rockets, the Butterfly is under power the entire trip. Half way to its destination it turns around, and the ion thrust is used to slow the craft down to arrival speeds.

Since its thrust is entirely inadequate to cope with the gravity of major planets, the Cosmic Butterfly never lands. It is assembled in space and shuttles betw artificial satellites.



The Cosmic Butterfly could carry passengers and 50 tons of cargo an Earth satellite to a comparable orbiting around Mars in about one of continuous travel.

Inertial navigation systems will pla increasing role in the exploration of space. ***ARMA***, now providing such tems for the Air Force ATLAS ICBM be in the vanguard of the race to space. ***ARMA*** . . . Garden City, A Division of American Bosch Arma

BRIGHT DISPLAY

...WITH A MEMORY

Raytheon's two-gun memory tube makes possible MEMRAD,* a new approach to radar data display. In addition to its other capabilities, MEMRAD adds a new dimension in improving the detectability of targets by making possible the correlation of scan-to-scan data.

The PPI display is a continuous bright picture presentation, eliminating the conventional bursts of information. The system permits viewing with normal room illumination at any number of locations on standard TV-type monitors. Manual plotting is eliminated entirely. Furthermore, recognition and comprehension of target trails are made possible by presenting the recent history of target position. MEMRAD allows an immediate assessment of target velocity and maneuver, permitting discrimination between jet and conventional aircraft.

IN THE PENTAGON

The Administration still withheld announcement of its so-called "master plan" for missile air defense as M/R went to press. However, all signs pointed to a new compromise between the Air Force and the Army with both the **Boeing** *Bomarc* and **Western Electric** *Nike-Hercules* programs cut back somewhat, *Nike* probably getting the worst of it. Inter-service fighting over the basic issue of anti-air defense is expected to continue regardless.

A new interservice hassle . . .
may be in the offing over ARPA's Project *Transit*—development of a navigation satellite. The Navy has been handling much of the work, under overall ARPA management. But now that development is reaching advanced stages the question is which service is going to be given the system.

• • •

The Army is expected . . .
to pump the bulk of the extra $200 million voted it by the House into a production program for **Western Electric's** *Nike-Zeus*. That is, if the Senate goes along with the increase. The Army expects to be able to fire the 450,000-pound-thrust solid missile in 1960.

• • •

Move to establish . . .
a Strategic Command encompassing both Navy and USAF forces will probably live or die on the point of organization. Proposed now is a vertical Navy command, a vertical Air Force command for the strategic forces of each, with a unified commander over both. To say Navy is reluctant is putting it mildly, but it might agree if guaranteed certain command lines.

• • •

Maj. Gen. Charles M. (Sandy) McCorkle . . .
will leave the Pentagon early in July to assume command of the Air Force Special Weapons Center at Kirtland AFB, Albuquerque. His successor as assistant chief of staff for guided missiles will be Brig. Gen. Robert E. Greer, present deputy.

Both the Convair *Atlas* . . .
and the **Martin** *Titan* are all but certain to be used as second stages for *Saturn*—the clustered 1.5-million-pound-thrust engine being developed by the Army and **Rocketdyne.** *Atlas* will be used at first, *Titan* later.

• • •

***Discoverer IV* scheduled . . .**
for late this month or early July will not carry mice as did the ill-fated *Discoverer III*. However, if all goes well there will be another attempt to recover the satellite's biomedical capsule. The main purpose of the launching will be to check out all of the *Discoverer*'s equipment before making another attempt to recover an animal from orbit.

ON CAPITOL HILL

The Pentagon . . .
may be about to give a green light after all to speeding up development of the nuclear-powered plane—strategic companion of the ALBM. The Pentagon is scheduled to give the Administration's decision to the Joint Congressional Atomic Research Subcommittee this month. And congressional sources say chances are good for a go-ahead.

• • •

Candidate for star-studded . . .
congressional investigation of the year: The House Armed Services Investigating Subcommittee's forthcoming inquiry into the hiring of retired military and government officials by defense contractors. It's expected to begin about July 1. And it could result in a headline-hunt for alleged "collusion"—enlivening many a front page while Congress is in recess.

AROUND TOWN

Some of the reports . . .
that are being passed as the "latest" in the nation's capital:

. . . The Air Force is thinking of developing a rocket-ground effect train for transporting missile cars swiftly.

. . . If the cold war gets hotter, both Republicans and Democrats will vie with each other to become the "Big Defense" party during the 1960 election year.

. . . The Senate Space Subcommittee headed by Sen. Stuart Symington (D-Mo.) will recommend major shakeups in the organization of the nation's space agencies.

Bloodhounds ready for launching during acceptance trials at Woomera

EFFECTIVE

More advanced Bloodhound for defence of UK confirms particular suitability for European defence needs

Already in operational service with the RAF and adopted by non-NATO Sweden, Bloodhound Guided Weapon System is now to be further developed for the RAF.

This developed Bloodhound possesses substantially increased operating range and altitude, with advanced technique ensuring still greater lethality at these increased ranges and heights. Low altitude performance is further improved to counteract the threat of low-flying targets.

Development, rather than replacement, of Bloodhound offers the obvious economic and operational a inherent in making use of an existing system.

Proved in many hundreds of test firings; Europe's largest missile-manufacturing com particularly suited to European defence need Ferranti Bloodhound forms *the world's most e fence system now and for many years to come.*

for the conquest of space

WHAT KIND OF ENGINE FOR A SPACE-JEEP?

It takes a unique engine to jockey a space-jeep in for a landing on an orbiting space station—one that will give a space pilot instant control and precise maneuverability.

Such an engine is the fully controllable rocket engine—ideal for space travel yet as easy to operate as an automobile engine.

The rocket engines are ready now

Although the space-jeep is still a gleam in an engineer's eye, the controllable rocket engine is available now...and has immediate application for existing aircraft. The pilot of a plane with auxiliary rocket power can switch it on for sudden, swift acceleration at high altitudes . . . the aircraft's air-breathing turbojets supplying power for ordinary flight operations. This is the mixed-power theory. Since World War II several mixed-power concepts have been developed in foreign countries, including Russia, France and England.

Extra power for today's aircraft

Rocketdyne already has designed, tested, and manufactured rocket engines for mixed power applications. The AR-1 rocket engine is a liquid-propellant system, as are the large power plants for the Atlas, Thor, Jupiter, and Redstone ballistic missiles. The AR-1 passed stringent flight tests as a supplementary power plant on modern jet aircraft. Substantial improvements over normal near-sonic speed and 50,000-foot altitude capabilities were demonstrated in more than 100 test flights.

The AR-2, second in a series of four rocket-engine models developed by Rocketdyne, is a fully-throttleable engine that provides varied thrust. Using fuel from the airplane's t[a]nk—which automatically ignites [w]ith hydrogen peroxide—these eng[ines] have full stop and restart capabi[lity].

More value for taxpayers' mone[y]

The auxiliary rocket engine [gives] present aircraft superperform[ance] capabilities at a relatively low co[st] provides the increased speed and [ma]neuverability that could spell the [dif]ference between the success or fa[ilure] of an intercept mission. Almost [any] existing jet aircraft, as well as [those] now on the drawing board, ca[n be] adapted readily for AR engines.

Looking forward to tomorrow

Beyond a doubt, rocket power [will] leading role in the Free W[orld]'s future. Rocket-propelled airpl[anes] such as the X-15, will pave the [way] for man's entry into Outer S[pace]. The multi-million-pound-thrus[t sys]tems that are now under develop[ment] at Rocketdyne will be man's r[ocket] to explore interplanetary Space. [In the] meanwhile, these rapid advanc[es in] rocketry can add great streng[th to] America's present deterrent ar[senal].

THE MEASURE OF ROCKET PO[WER]

The liquid-propellant AR[-1] engines are "static test" Rocketdyne's field labora[tories] measure thrust and perfo[rmance]

industry countdown

STRUCTURES

Preoccupation with the *Bomarc-Nike-Hercules* scrap has held up a decision on the *Dyna-Soar*. But most insiders think that since both **Boeing** and **Martin** had many good points in their separate proposals for the boost-glide bomber, the contract is unlikely to go to either company exclusively. They will most likely get the contract as a team, with one being named prime agent.

Announcement is due shortly . . .
that lucrative arming and fusing contract for *Polaris* will go to **Crosley Division,** Avco Mfg. Crosley, which does *Titan* fuzing, will get the contract from the Naval Ordnance Laboratory.

• • •

Vehicle test programs . . .
of **Lockheed-Convair, Martin** and **McDonnell** ALBM concepts are continuing under AF contracts—with results going to **Douglas** which has development contract. Over Cape Canaveral last week, Martin successfully fired its two-stage solid-fueled *Bold Orion* concept. It traveled more than 1000 miles.

PROPULSION

There are indications . . .
that NASA may undertake another parallel development program in multi-meg liquid boosters with contract ball possibly being passed to **General Electric.** GE has plugged nozzle concept which is creating a good deal of interest and speculation; has put about $1 million of its own money into the concept—designed to eliminate heavy and complex metallurgy such as thrust vectors, jetavators, gas bleeds, verniers, etc. Material for cone-shaped plug and fabrication techniques are closely guarded proprietary information, and there are patent rights to be settled. GE isn't talking except to opinionize that conventional design for large-meg boosters will be too costly and will run into too many combustion and stabilizing problems.

• • •

The cheaper fuels . . .
probably will have to be used in million-pound thrust boosters. Just multiply costs per pound of propellant at flow rate of 6000 pounds per second at 1.5 meg and you come up with astronomical fuel charges.

ELECTRONICS

Some market analysts . . .
are predicting silicon transistor sales to upswing sharply from estimated 47.1 million units in 1958 to 69.6 million in 1962. Switching performance reportedly is the best feature of silicon in missile and computer applications, with low reverse current an important factor.

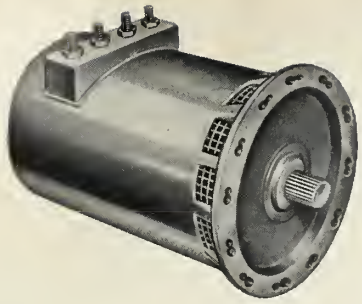
• • •

With many problems . . .
still unsolved in visual search and recovery of space vehicles, look for stepped-up action in the next few months in connection with Project *Mercury*. While water landings are still planned, new techniques for sighting capsules are under investigation for mountainous terrain, wooded and snowy areas.

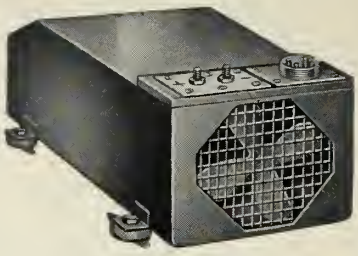
• • •

High altitude recovery . . .
of 15,000-pound *Atlas* used as *Mercury* booster is programmed before end of this year. Method is being developed by **Space Recovery Systems Inc., CBS Laboratories** subsidiary, utilizing "marriage" of electronics and aeronautics to trigger parachute and return equipment to pre-determined area.

• • •



Booster recovery . . .
would save millions of dollars worth of hardware which could be used over again. But some industry skeptics believe development of reliable recovery system will cost more than boosters—particularly if they can be made cheaper in mass production.



ASTROPHYSICS

"Moon-chips" . . .
is name given to stone meteorites by Dr. Harold C. Urey, University of California, who theorizes they may come from collisions between meteors and face of the moon. Chemical composition of "chips" is unlike anything found on earth. Measurement of their cosmic radiation exposure content indicates age of 2 million to 90 million years, which Urey believes would put origin near earth's orbit. Iron meteorites on other hand have exposure time of 100 million to 1.5 billion years, suggesting they may have originated between the orbits of Mars and Jupiter.

SPACE MEDICINE

Required reading . . .
for astronauts: *Human Tolerance to Prolonged Forward and Backward Acceleration.* Report on g effects found in tests on WADC human centrifuge is available through OTS, U.S. Department of Commerce.

WEIGH THEM...PRICE THEM...MEASURE THEM.. THEN COMPARE THEM WITH LELAND AIRBORNE'S NEW DUAL-WOUND AC-DC GENERATOR...

A single unit delivering Controlled AC and DC!

Normally, a 20 KVA AC generator at 8000 RPM weighs 42 to 44 lbs. including regulator...a 200-ampere unregulated transformer rectifier weighs 20 to 28 pounds, with a maximum total weight of 72 lbs. Leland's integral, dual-wound AC-DC generator, for the same application, weighs only *53 lbs. and eliminates the extra space, weight and cooling requirements required for the transformer rectifier.*

Directly connect your DC load to LELAND AIRBORNE'S new AC-DC generator ...less weight, less space, less cost.

MAGAZINE OF WORLD ASTRONAUTICS

AF Cataloguing Support Items

Massive volume due July 1 should save millions in wasteful development of redundant equipment and should standardize handling and checkout gear

by William E. Howard

Sixth of a Series on Missile Support

WASHINGTON—Within a few weeks Air Force—with industry's help—start closing the missile support formation Gap."

Coming off the presses about July 1 the first 500 pages of what eventu- will be an encyclopedic catalogue ng missile/aircraft support equip- it purchased or under development the Air Force. It will be called the port equipment "Technical Informa- File."

As the first inventory of the vast port field, TIF appears destined hape the industry's future for years ome. Pentagon procurement policy ers already are counting on it to me the key instrument in:

- Saving millions of dollars by inating wasteful development of ndant equipment and continued urement of obsolete equipment.
- Standardizing ground handling checkout devices at a further sav- in more efficient procurement and ing of maintenance personnel.
- Bringing about development of lti-purpose" support items—capable erving more than one missile, or aps both a missile and its carrier ane.

Moreover, the Air Force TIF is the runner of a Defense Department e to standardize missile/aircraft ort equipment development and urement throughout the armed es, M/R has been told. A study ect (MISC0001) headed by the Air e is trying to establish a system an Army-Navy-Air Force TIF.

he study group already has reached rvice agreement on a format for sheets to describe equipment. It nilar to the Air Force TIF format. the knottier problems of organiz- ing a catalogue so that it can be used as a common purchasing and design reference by all three branches of the military remain to be resolved.

• Unification step?—Success of this project might in itself be a giant step toward bringing about practical realization of the old, much-talked-about, long-pigeonholed dream of unifying the services.

The Air Force TIF is a half-step, at least, in this direction. The DOD is making its use mandatory by Army and Navy procurement officers and contractors.

Differences in weapon systems and sheer magnitude of their ever-multiplying back-up requirements make even the compilation of a one-service technical information file an enormous task. Following up the first 500 AF TIF data sheets will be 23,000 more in a month or two. Listings eventually will reach the hundreds of thousands.

The TIF is being put together by the Air Force Directorate of Supply in the Air Materiel Command at Wright-Patterson AFB. Heading up the job is Martin Connelly, chief of standardization in the Office of Cataloguing and Standardization.

The spawning of whole new families of support equipment during the past few years to service new missiles, says a high Pentagon official, "has created a horrendous problem in training maintenance personnel. Even the checkout equipment has to be checked out.

"It's like fleas having fleas."

TIF will be mostly unclassified. The catalogue will be loose-leafed, so that pages may be removed and new ones inserted as equipment becomes outmoded or there are other changes.

Distribution presently is planned to all prime weapon system and support contractors and military procurement officers. Additional copies will be available at local Air Force procurement districts. An initial press run of around 2600 copies is planned.

But Lt. Col. Oscar B. O'Neill, who headed the industry-Air Force task group which created TIF, concedes that demand very likely will dry up the supply in a twinkling. "This is going to become the Sears & Roebuck catalogue of the missile business," he says with a smile.

O'Neill is chief of the support equipment division, Logistic Support Office, Aeronautical Systems Center, at Wright-Patterson. As chairman of the industry-Air Force group, he supervised the overall development of TIF.

Contributing from industry were representatives of Aerospace Industries Association, Electronic Industries Association, the Society of Automotive Engineers and the National Security Industries Association.

To obtain complete Air Force representation, members were seated on the group from USAF Headquarters, from every AF directorate, the AMC, every air materiel area and depot, all commands such as SAC and TAC and from overseas units.

Field technical requirements came from 16 Air Force Equipment Advisory Groups, comparable to Weapon System Phasing Groups, which are charged with maintaining a continuity of experience in support equipment.

Support equipment catalogue . . .

EAG's were formed also to help promote more "commonality" among ground systems.

Today, an effort is being made to put together in the Air Staff an equivalent group—perhaps informal—to keep going where O'Neill's TIF group leaves off. This would be a support equipment "management panel" to act as a watchdog, keeping a cross-system check with TIF as the guidebook.

"For the first time," says an Air Force official, "we are going to be able to comprehend the size of the support effort." Missile support alone is estimated at more than $3 billion a year. But until TIF no effort had been made officially to compile a complete support equipment inventory between two covers.

• **Designers' quandry**—For some time Air Force regulations have enjoined weapon system contractors to recommend and design into a missile equipment that is currently in use—either "as is" or with modifications. If this is not available, they are to utilize off-the-shelf commercial equipment currently in the Air Force supply system, or other off-the-shelf commercial equipment. Only as a last resort are they supposed to design a piece of equipment from scratch.

The big problem for designers, however, has been in learning what is available, or is likely to be available when they need it, and if it will meet the specs of their system. In some cases, industry officials say, acquiring this information would have entailed major research. So it was faster to design what was needed rather than waste time hunting for a piece of equipment which might not exist.

"Everybody realizes that this produced an awful lot of redundant equipment that was wasteful," comments a member of AIA. "But what were you to do when a weapon was wanted in a hurry?"

TIF will eliminate this information gap. Henceforth, designers will only have to flick through its pages to know what can be turned to their use. This includes equipment which is still in the development stage, but which has progressed far enough to be described on a data sheet.

On the other side of the coin, military procurement officials will have in TIF a handy reference to police contracts. They can tell whether a contractor is following the requirement to utilize equipment that is procurable, or is proceeding willy-nilly to develop it over again.

• **Data sheet format**—Listings will be only of equipment that has procureable status. This means that a manufacturer will have his piece of equipment entered in TIF only if it is in use or on order by the Air Force. The item won't be included otherwise—even if it is identical down to the angstrom with a competitor's item that has status.

Since data sheets will give the name of the manufacturer, some DOD authorities believe the advent of TIF will provoke some "real wild" competition. The low bidder gets in the catalogue, and thus will have an advertising "track" for his item to be designed into future weapons.

Specifications for data sheet preparation by companies, as detailed in MIL-D-19731A, call for sufficient precise data to familiarize maintenance and engineering personnel and government contractors with the "characteristics and physical make-up of the equipment used in support of aircraft and missile systems."

For contractors, they are "intended to provide sufficient information for determination that an item of equipment is suitable or unsuitable for a contemplated application, usually without recourse to supplemental detailed data." However, the data sheets require the reporting of where detailed information is available. This can be requisitioned if the information needed for possible modification of item.

In addition to an illustration of t item, the data sheet also will provi a brief functional description, applic tion and what it is used with. Its re tion to similar equipment also is giv along with a technical description.

This latter description, in tabu form, gives the frequency range, pow output and/or input—including amp age, KVA, number of wires, pha type of receptacle or plug—other p tinent electrical and mechanical ch acteristics, dimensions etc.

Once the TIF compendium is co plete, Air Force officials believe th will be able to proceed to "optimiz standardization of such items as liq fuel generators, fuel transport, stor and service equipment, and other h dling items required by missiles. Th hope to come up with automatic che out equipment for air-to-air and to-surface missiles that is compati with and capable of checking out s tems of launching plane or other m siles.

And, important to suppliers, che out equipment also would be standa ized in Air Force bases and depots that if the mission of a base is chan equipment may be transferred to other base and not junked.

An Air Force official was aske TIF and the mounting push tow missile support standardization m tend to "freeze" some weapon syst and hamper future development others.

"That might be so," was the re "But, on the other hand, where do stop on gold plate? By knowing wh we stand, with the Technical Infor tion File, we will have a better cha of striking a balance of optimum formance with optimum economy."

About the Cover

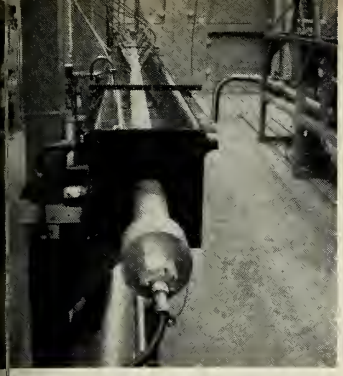
The *Nike-Hercules*—the Army's entry in its rivalry with the Air Force to maintain the nation's anti-aircraft defenses—is being turned over to Nationalist Chinese troops to guard Formosa (Taiwan).

The Western Electric *Nike-Hercules* first appeared on Formosan soil last year during the Quemoy-Matsu crisis.

U.S. troops set up and manned a 48-launcher battalion of the 75 to 100-mile range missile capable of knocking down enemy aircraft with both conventional and nuclear warheads.

About half of the U.S. troops who manned the *Nike-Hercules* on Formosa already have been withdrawn. Their posts have been taken over by Nationalist Chinese. The switch is scheduled to be completed by mid-August.

Nikes in the hands of the Nationalist Chinese will not be equipped with nuclear warheads.



However, U.S. Air Force units on Formosa will continue to man nuclear warhead-tipped Martin *Matadors*.

Heat and Meteorite Impact Effects Studied

DOWNEY, CALIF.—A study of interaction of surface materials and high-temperature boundary of air rounding a high-speed moving has been undertaken by the Aero-S Laboratories at North American tion's Missile Division.

The advanced research proje sponsored by the Army.

A second area of investigation, for the Army, is a laboratory in which minute particles simul meteorites will be bombarded a various materials to determine in effects. Speeds near those of par in space will be achieved with high-velocity equipment being veloped by the laboratories.

CK WAVES resulting in pressures up 0,000 pounds psi are measured in the less steel detonation tube. Walls are half inch thick.

AF Pushes Research On Detonation Problem

by James Baar

WRIGHT-PATTERSON AFB—A multi-ion-dollar missile is on its test d. Its propellant ignites. Seconds t a blast rips through the missile leaves it a pile of blazing ruins.

Why?

And what can be done about it?

One of the keys to answering these tions is a better understanding of phenomenon known as "combus- instability." Some call it "oscil- y combustion."

It results in considerably higher normal pressures, temperatures rates of heat transfer.

A team of scientists at the Aero- ical Research Laboratory at Wright Development Center has been in- gating the phenomenon in a newly- laboratory for the past year.

Their research could lead to:

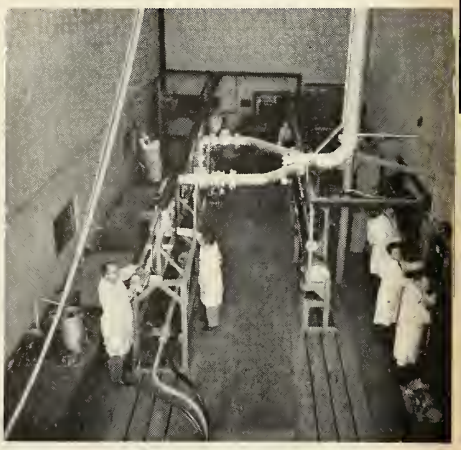
- Much greater reliability of missiles spacecraft boosters.
- More efficient combustion systems lighter and smaller engines.
- Removal of a principal roadblock to "scaling up" the huge rocket systems needed for space exploration.

The Air Force scientific team headed by Bernard T. Wolfson has constructed for their investigations a special high-pressure detonation research facility. Their equipment enables them to measure fundamental detonation parameters under the conditions present in rocket engine combustion chambers.

The pressure of exploding gases at the time of detonation and the velocity of the resulting shock wave are measured in a stainless steel 15-foot detonation tube. Its diameter is 1½ inches. Its walls are one-half-inch thick.

Pre-mixed gases from remotely located high-pressure storage tanks are fed into the tube and ignited. An electronic timing system capable of clocking passage of the shock wave to within one-tenth of a microsecond takes five readings as the wave moves down the tube. Pressures are measured by a recently developed system capable of accurately measuring large pressure changes ranging to 100,000 pounds psi in a reaction time of less than one-half of a microsecond.

The scientific team also is using:



- An 18-foot shock wave-flame interaction tube to investigate the interaction of a shock wave with a stabilized flame front and ignition of a gaseous mixture by shock.
- A 25-foot flow detonation tube for observing the influence of gas flow on detonation wave characteristics.

Both the deflagration and the flow tubes are equipped with windows for visual observation by means of high-speed photography. The 3-inch-wide tubes are made of chromium molybdenum steel.

The investigators are using a Beckman and Whitley ultra-speed framing camera to take pictures of the detonation waves which reach speeds of Mach 10. The camera takes 25 pictures of the wave as it passes an observation window in 1/15 of a millisecond.

LW TUBES for investigating shock- ar: interaction and influence of flow n detonation wave characteristics.

OVERALL VIEW of Air Force high-pressure detonation research facility. Lab has blow-out panels in case of accident.

How Do We Make Weapon System Integration Work?

AF has established Project Offices with broad authority for overall management of all phases

by Betty Oswald

WASHINGTON—Traditional methods of doing business with the Defense Department will have to go by the boards in the years ahead. This means, according to Gen. Edwin B. Rawlings (USAF, ret.), long-time boss of the Air Materiel Command, that the development of new and complex missiles, rockets, space ships and other weapons is forcing the disappearance of the traditional distinctions between research and development, procurement and production, and maintenance and supply.

Quantity production is a dead issue with the high-yield weapons of the future. Today, the talk is of building 40 B-58's in a year—little more than three a month—and of 70 B-52's with fiscal 1960 money. And very limited numbers of very high-cost missiles are obviously in the cards.

These facts, together with the complexity of new weapons and the difficulty of making a complete weapon system operational in the earliest possible time period, lead inevitably to weapon system management and integration and to less rather than more advertised bidding, according to military spokesmen. This is hard for Capitol Hill to swallow because with the shift to limited production, costs are soaring, plants are closing and will close, and small business is perennially in trouble.

This means that the Congress, looking at the highly undesirable end results, is blaming this new and admittedly creaky process known as the weapon system management concept, rather than the change in weapons, according to both military officers and men who deal in weapon system management from industry.

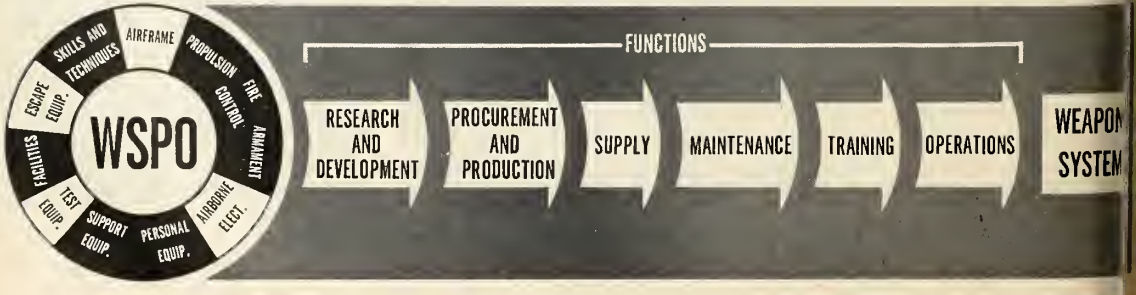
As they see it, the job is to make weapon system integration work. Key to the effort is the Air Force Weapon System Project Offices now set up both by the Air Materiel Command and the Air Research and Development Command.

• **No delegation**—In talking of Project Offices, which are the focal point of the effort to push out a complete weapon at the earliest possible time, AF officers make it plain that they are not delegating their authority or responsibility to the prime weapon system contractor, despite charges sometimes made.

The Weapon System Project Office is basically responsible for the overall management of development, procurement, production, supply, maintenance and integration of each assigned weapon into the Air Force inventory. Hence it is the contact point for both the Air Force itself and industry.

It was created in its present important place in the AF structure in full recognition of the fact that y can't manage development—or for th matter procurement and productio supply or maintenance or even traini and operation, in a vacuum. Integ tion, according to the modern day e perts in logistics, represents the key.

It's important to know right fr the beginning, when the launching pa will be needed, the type of person which will operate and maintain t equipment, the training effort wh will be required to obtain necessa skills, and the facilities which will needed both to produce and to ma tain the new weapons.



This means that the WSPO's staffed by experts in all of the ma elements of the system, including frame, propulsion, fire control, borne electronics, support and t equipment, facilities, aircraft esca equipment, as well as by people w know what skills and techniques w be required for an operational syste

• **Responsibility**—Management the office depends on whether weapon is only in development, whether the decision has been made produce it for inventory. If the p gram is still in the technical devel ment stage, ARDC has what is kno as "executive management respo bility." If a decision to produce been made, "EMR" shifts to AM This by itself could cause unnecess delays in the program.

In an effort to cut across the wh structure of the AF and eliminate problem, ARDC and AMC weap system project officers are kept wo ing together—either in the sa room or across the hall and on Weapon System Phasing Groups w representatives not only from AR and AMC but also from the Train and Using Commands and from Force headquarters.

These groups meet at least onc month under the chairmanship either ARDC or AMC, depending which command has executive m agement responsibility.

How each group handles its pr lems will be the subject of l articles.

Aerojet's New Sounding Rockets

Company is already taking orders for Astrobee series reportedly costing less than Aerobee but offering improved ease of handling, thrust alignment and attitude accuracy

by Frank G. McGuire

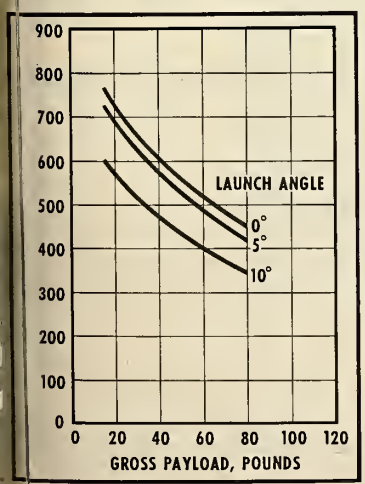
AZUSA, CALIF.—A new series of sounding rockets to take over where *Aerobee* leaves off has been proposed by Aerojet-General Corp.'s Systems Division. Named *Astrobee*, the rocket would consist of two basic vehicles, the *Astrobee-200* and the *Astrobee-500*, with an attitude-control system available if desired.

The *Astrobee* design grew out of an Air Force request through its Cambridge Research Center for a staged solid-propellant rocket with 200-mile-altitude capabilities carrying moderate payloads. The resulting design, *Astrobee-200*, will carry 120 pounds of useful payload to that height.

The larger version, *Astrobee-500*, will carry a gross payload weight of 250 pounds to 725 miles. These performance figures assume a 5° launch angle at sea level.

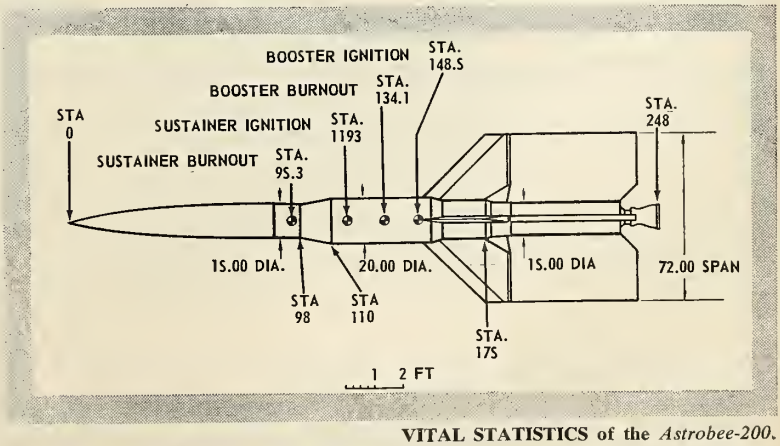
The first flight test in the series is due in late fall from Fort Churchill, Canada.

Costs on the *Astrobee* run somewhat below the *Aerobee;* the *200* costing about $10,000 to $15,000 and the *500* from about $15,000 to $20,000. Standard materials, such as aluminum fins, are used for construction. The nose cone is composed of an ablative material for re-entry.



Aerojet has received orders for two *Astrobee-500* rockets and has quoted prices on four more.

Advantages of the new series, as cited by AGC, are ease of handling and servicing, improved thrust alignment, and close manufacturing of longitudinal and lateral centers of gravity. Both versions were designed for launching from rails, and feature fin stabilization and high initial acceleration.



• **Breakdown**—Gross launching weight of the two-stage *Astrobee-200* is 1689 pounds (with zero useful payload). Breakdown of the rocket booster, 593.5 pounds; sustainer, 1071.5 pounds; payload compartment, 24.0 pounds. Payload compartment weight includes that of the heat shield. The booster is a modified MB-1 solid-propellant motor such as used in the *Genie* AAM.

Astrobee-200 is approximately 20.6 feet long overall and its total span is 72 inches. (Booster and payload compartment diameter is 15 inches and sustainer diameter is 20 inches.) The length breakdown: booster, 73 inches; sustainer, 77 inches, and payload compartment, 98 inches.

Aerodynamic heating on the *Astrobee*'s surfaces has been calculated by AGC engineers, and appears as a sharp climb after 25 seconds of flight. At this point, temperature at three inches from the nose is about 175°F,

PERFORMANCE of *Astrobee-500* in sea level launchings with 12-sec. coast time.

VITAL STATISTICS of the *Astrobee-200*.

ASTROBEE-200 TRAJECTORY SUMMARY

Alignment of input axis of gyro to gyro case	1 MIL.R	1 MIL.R.
Alignment of gyro case to reference axis	1 MIL.R	1 MIL.R
RMS Total	0.085°	0.097°.

*For purposes of this study, an environment of 100 g² was assumed.

climbing to 1300°F by 45 seconds. At 18 inches from the nose the temperature shows a rise from 125°F at 25 seconds, to over 600°F at 45 seconds. Leading edges of fins show similar temperature rises, but none of the heat increases reaches a critical stage.

The three-stage *Astrobee-500* achieves a maximum altitude of 765 miles with a 15-pound gross payload. This performance changes as payload weight changes, and a 600-mile peak altitude is reached with a 40-pound payload.

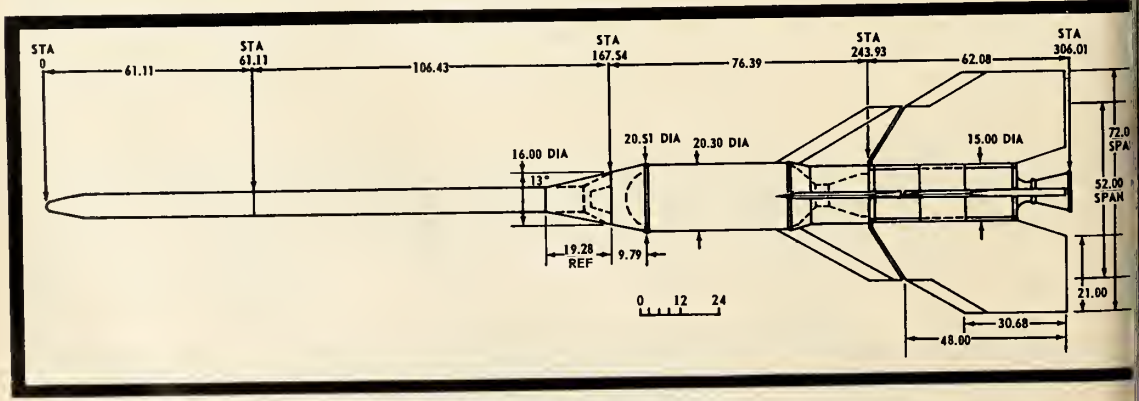
Launching weight of *Astrobee-500* is 1862.3 pounds, without payload section, with breakdown as follows: first stage, 602.5 pounds; second stage, 1050.5 pounds; third stage, 209.3 pounds.

Overall length is about 25.5 feet and the span is 72 inches. The first two stages are the same as in the *Astrobee-200*. With the MB-1 booster and the 30KS-8000 second-stage motor (eventually to be used with *Thor-Delta*), is the third-stage *ASP* rocket.

• **Optional equipment**—An attitude-control system has been developed as an optional addition to the *Astrobee* series. Designed to carry a special camera, the payload section can be recovered intact, as well as properly oriented during photography. Dispersion of the film magazine on its return to earth is kept at a minimum. The attitude control is in operation during the entire ascent of the vehicle and the initial phases of descent.

The attitude control equipment for the *Astrobee* series is comprised of an inertial reference system, a reaction-jet servo system, electrical power supply, and a reaction-jet fuel supply. High-pressure nitrogen or air is used as the working gas for the reaction jets. The servo valves control reaction-jet thrust in proportion to a dc electrical signal received from the guidance mechanism by discharge of the compressed gas. A closed-loop pressure-regulation system is used to obtain good linearity and essentially constant thrust sensitivity.

Although the control system for the *Astrobee-200* is also applicable to the *500*, there is an independent system used for the booster of the *500*. Due to the large difference in thrust and total impulse of the two upper stages and the booster, the attitude-control system for the booster is large enough to correct maximum thrust misalignment during operation. The system is contained within the booster and separates with it.



• **Guidance**—The guidance system uses a body-mounted inertial reference of floated rate and rate-integrating gyros. It provides varying rate dc voltages to the appropriate actuation members for the purpose of attenuating disturbing influences on the vehicle. The three miniature rate-integrating gyros accept command voltages to the control system, sense angular velocity about the three major axes, and pr duce corresponding integrated r error output voltages.

The rate damping package has thr orthogonally-mounted rate gyr aligned to the major axes of the v hicle. They measure angular velocit about these axes and supply inform tion to the system for correction.

The electronic compartment, whi provides for the acceptance of d placement and rate information, w forward the data to the appropri polarity-sensitive actuation assembli Other functions of the compartm include gyro temperature control, g monitor circuitry, power amplifiers the gyro spin motors, gyro pickoff citation, preamplifiers, demodulat filters and summing preamplifiers.

Power supply for the guida package and servo-valve assembl consists of 26-volt, 400 cps out from a 21-cell silver-zinc battery w static inverter. The supply occup 150 cubic inches and weighs pounds. Effective rated capacity is watt-hours/pound. Provision will made for possible programming wind shears, coriolis accelerations other effects, as the situation requi

Accuracy of the attitude system been analyzed by AGC, and it has b estimated that maximum angular r about a resultant axis at apogee be less than one-half degree second.

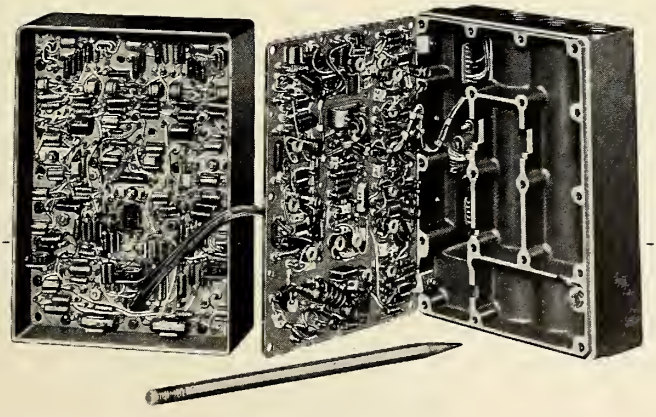
DETAILS of the *Astrobee-500*.

COMMAND DESTRUCT

The flight testing of second generation missiles—more versatile and powerful than their predecessors—requires a device for sure termination of any missile flight that might endanger the test range or surrounding area.

Ramo-Wooldridge engineers, under a United States Army Signal Corps contract, have successfully developed and delivered the first sub-miniature, completely transistorized radio "command destruct" receivers.

Specifically designed for missile flight safety operations, the receiver (AN/DRW-11) can actuate safety mechanisms or destruct devices. It has three command channels, each of which actuates a control relay.



The "command destruct" receiver accepts frequency modulated signals in the UHF radio command control band. It is designed to operate with closer radio frequency and command frequency channel spacing than has been used to date, thus making possible more efficient use of the available radio spectrum.

Compact and rugged, the radio receiver's modular construction permits rapid and complete accessibility to all components. One module houses the basic receiver. The second module contains the three command channels and relays. This integrated package occupies 115 cubic inches, and weighs 4 pounds. The receiver requires no pressurization and operates reliably under the adverse environmental conditions encountered in missile flight testing.

Engineers and scientists interested in being associated with some of the nation's most advanced research and development programs are invited to acquaint themselves with current opportunities at Ramo-Wooldridge. The areas of activity listed below are those in which R-W is now engaged and in which openings exist.

Missile electronics systems
Advanced radio and wireline communications
Information processing systems
Electronic language translation
Anti-submarine warfare
Air navigation and traffic control
Analog and digital computers
Infrared systems
Electronic reconnaissance and countermeasures
Basic and applied physical research

Space Feeding: Big $$ Market

Air Force contracting with industries on four lines of space food with bulk of work being handled through Quartermaster Food and Container Institute

by James Baar

WRIGHT-PATTERSON AFB—When the first U.S. astronaut eats his dinner in space, he will be munching on products that may put millions of dollars in the pockets of the nation's food industry.

Both industry and government food experts expect that many of the special new products being developed for space travel will be highly adaptable for sale at the corner supermarket.

At present, four main lines of space food are being developed under the direction of the Aero-Medical Laboratory at Wright Air Development Center:

• Semi-solid food in tubes—A wide range of fruits, meat and vegetables. Some of these are junior baby food with some seasoning added.

• Bite-size solid food—These are such things as bacon tablets, cheese tablets and malted milk tablets.

• Solid-food "lipstick" rods—Many of these are highly-nourishing grain mixtures in a variety of flavors. A main course item: Cheese and smoky rye. Dessert: Chocolate peppermint.

• Dehydrated foods—A wide range of fruits, meat and vegetables. Even casserole dishes. Just add water and stir.

The Air Force also is attempting to develop space food containers that can be eaten. There are two varieties of these: those that can be eaten without harmful results and those that provide some nourishment as well.

Most of these items are being designed not for the first manned space flights but for the much longer space flights to come.

The first flights will be only a matter of days at most. Therefore, semi-perishable food can be used to make up the bulk of the first astronauts' diet. It is when flights lasting a week, a month or even years are taken that the new space foods will be needed.

• **Water recovery**—Moreover, their use—particularly the dehydrated foods—is closely tied to development of a water recycling system. Such a system would make possible the reuse of human liquid waste products and eliminate the need for carrying great quantities of water in storage tanks.

American Machine & Foundry Co. has found in a study contracted by the Air Force that in week-long flights involving one or two men water could be recovered by a vacuum distillation technique. Impurities not removed by distillation could be removed by an ion exchange system or absorption.

The Air Force now is planning further studies on which techniques would be most practicable for water recovery in flights involving two men over periods of more than a week.

At the same time, the Air Force has contracted with AMF to develop a waste collection unit and with the Massachusetts Institute of Technology for studies of methods for recycling solid waste products.

However, a number of scie close to the space food program not overly enthusiastic about the As Dr. Harry C. Dyme, chief of Aero-Medical Lab's Nutrition Sec put it:

"We all know that the recy process is what keeps the world g We use fertilizer to grow food tha eat. But to have the recycling goin in such a closed environment space ship might be a little disqui psychologically."

Still, Dyme said, such a sy might be essential in order to pr enough food for a crew during i planetary flights that could last than a year.

For example, algae might be g on waste products. Then, after p cation, it could be mixed with drated cereals.

• **Participation**—The bulk of Aero-Medical Lab's space food opment is contracted through the termaster Food and Container stitute. Much of the recent worl the Institute has been handle American Can Co., Gerber Pro Co., Colton Machinery Corp. Dryve Foods. Work also has been by such meat packing firms as and Armour.

American Can, Colton and G produced the tubes of space food rently being tested by the Air Fo

The sterilized tubes are lined

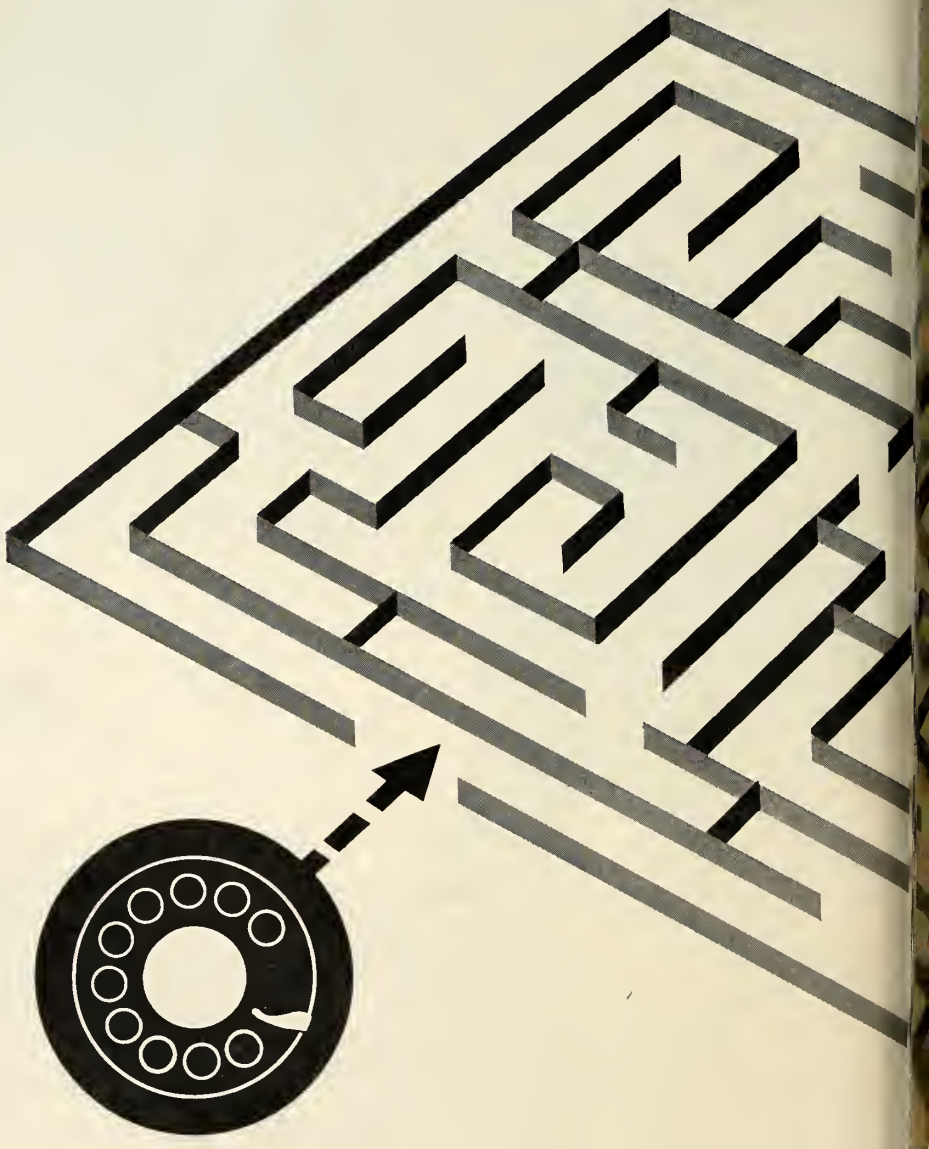
Martin Lacrosse Plays Deadly Game

Mobile as a chess queen, quick as a rapier thrust and as lethal as brass knuckles, the Martin Orlando Lacrosse is a handy weapon in a scrap. Developed, designed and built for the U. S. Army, the Lacrosse can flit like a ghost behind the battle area, fire in the general direction of the target and be pin-pointed by a forward guidance station.

The Lacrosse's ability to change its mind while in high velocity flight is another in the growing list of accomplishments by the men of Martin Orlando. Additional prime contracts include the Bullpup, air-to-surface missile, the Pershing, selective-range surface-to-surface missile and the Missile Master, electronic detection and control system for missile batteries.

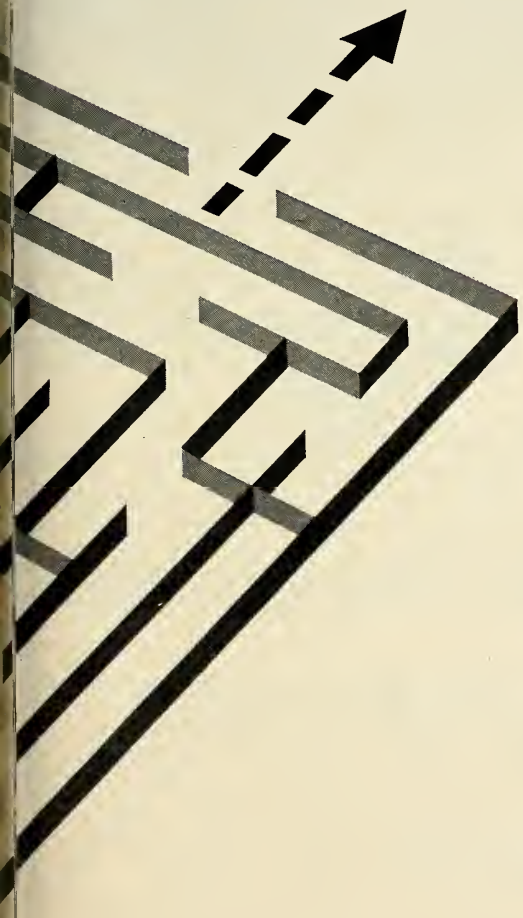
Blue sky vision plus feet on the ground know-how has projected Martin Orlando to its place of leadership in electronics and missiles. Martin Orlando needs men with gray matter, the solid propellant needed to reach ever higher degrees of sophistication.

Immediate openings at senior level exist for Electronic Engineers, Physicists and Electrical Engineers in these areas: pulse circuitry, electronic packaging, transistor circuitry, electronic production test equipment, digital and analog computers. Also opportunities for men experienced in calculating solid state parameters, molecular distribution and quantum mechanics. Send confidential resume to: J. F. Wallace, Director of Professional Staffing, The Martin Company, Orlando 44, Florida.



MARTIN
ORLANDO

Ft. Sill, Okla., June, 1959—The first two U. S. Army Battalions employing highly accurate Lacrosse surface-to-surface missiles will be activated this month. Martin Orlando is supplying all the material required for the activation, including maintenance, training devices, launchers and missiles.



Automation cut its teeth on th

...how ITT's early work in telephony advance

elephone

e art of automation

The dial telephone exchange was one of the first examples! Today, automatic switching and new electronic techniques for automation are altering the operations of virtually every business and industry.

It was natural that ITT System companies, pioneers in the first, should be leaders in the second.

Customers have ranged from mail-order houses, railroads, libraries and oil companies to the air forces of several NATO governments.

There have been dramatic results.

One example is the automatic check-processing system developed by ITT System companies for one of the nation's largest banks. It codes, sorts and verifies checks. It performs all normal bookkeeping and accounting operations for demand deposits.

Another is the automation system for a large steel mill which records the program of requirements for every job, then feeds back information to production control centers as each phase is completed.

Still another: the first automatic U. S. post office, now under construction in Providence, Rhode Island.

Hundreds of others could be cited. Each required a complete understanding of automation from the design of a simple switch to the functioning of a fully-integrated electronic complex.

The ITT System has many specialists in this field. Among them: Intelex Systems Incorporated in retained-document automation; Kellogg Switchboard and Supply Company in automatic switching; Airmatic Systems Corporation in automatic-switch pneumatic tube and document-conveyor systems; ITT Federal Division in automatic test equipment, both military and industrial. ITT's European subsidiaries add to this experience.

To learn more about ITT's abilities in the area of automation, write for further information.

SPACE FEEDING

(Continued from page 28)

epoxy resin and hermetically sealed to prevent spoilage. They can be stored indefinitely. To use in the weightless environment of space, an astronaut would screw a specially-developed pipe to the top of the tube and press the food through it into his mouth.

The Air Force also is testing a special metal tube squeezer designed to make emptying the tube easier.

American Can and Gerber have provided the Aero-Medical Lab with nine varieties of tubed food. They include veal, pork, chicken, tomatoes, macaroni, peaches and beef soup.

The Bradley Tube Division of American Can also has done some work on putting oleomargarine and fresh water in tubes.

Dryve Foods of Kansas City, Mo. has developed about a dozen varieties of solid space food items in the shape of rods. An astronaut can feed these into his mouth through his helmet by using a rod container that operates as a lipstick.

The Institute itself has developed a number of the bite-size solid items such as cheese tablets.

• **On the shelf**—Actual Air Force investment in space food research has been small because of the eagerness of a number of food industrialists to explore the field for commercial development. Many contractors have paid for much of the work themselves. And some of the ideas developed are already appearing on store shelves.

Peanut butter is being packaged in tubes. So are a number of luxury items.

"Acceptability is the big thing," Dyme said. "We want to get items that will appeal to astronauts over long periods. Many such items, of course, would have commercial appeal also."

In order to achieve acceptability, the seven *Mercury* astronauts now in training as well as others will be called on to test space food items over various periods of time both for its appeal and for its nutritional qualities. Probably a training table will be set up.

In the end, the food put aboard the first U.S. manned space capsule will be tailored to the astronaut who will ride inside of it.

"It's of the utmost importance," Dyme said. "You know, this man will be under terrific stress. And the three things that relieve stress are women, liquor and food. We can't send any women or liquor along. The least we can do is give him food that won't add to his stress—or maybe will even lessen it a little."

more about the missile week

X-15 Has Dry Run; Powered Flight Next

Powered flight test of **North American's** *X-15* rocket plane is expected around July 1 following "100% successful" glide June 8. With Pilot Scott Crossfield at controls, *X-15* was dropped from B-52 at 38,000 feet with air speed 517 mph and landed at 185 mph after 310-second glide over the Mojave Desert, at Muroc, Calif.

First U.S. Post Office delivery of mail by missile was accomplished June 8 when a subsonic **Chance Vought** *Regulus I* carrying 3000 letters was dispatched from the submarine Barbero 100 miles at sea to Mayport Auxiliary Naval Air Station, Jacksonville, Fla. Envelopes bore pictorial cachet and the words: "First Official Missile Mail." Stunt was to demonstrate feasibility, but it is expected to be a long time before regular system is developed.

White House Press Secretary James C. Hagerty predicts an instantaneous, global telecast relayed by earth satellites will take place within 30 months. Hagerty says there is a "40% chance" the feat may be accomplished within the next 18 months—while he is still in the White House.

Saturn Blockhouse

Contract for domed, 9000-square-foot *Saturn* blockhouse at Cape Canaveral has been awarded to **Diversified Builders, Inc.,** Cocoa Beach, on a bid of $819,000. **Paul Smith Construction Co.,** Orlando, has $529,000 Corps of Engineers contract to erect a 22,000-square-foot engineer facility and other buildings at the Cape.

The Navy has named **Sperry Gyroscope Co.** navigation systems manager for four second-generation 608 class *Polaris* submarines . . . **Callery Chemical** has AF contract to supply boron-based high-energy HiCal for secret missile project . . . Special construction totalling about $4 million is underway at AOMC's White Sands Missile Range in preparation for *Nike-Zeus* tests.

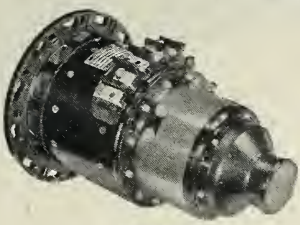
Small business firms were awarded $79 million worth of government contracts during April under the Small Business Administration set-aside program. This was an increase of about $10 million over March.

Discoverer Back-Up

Back-up to *Discoverer III* mice-in-space attempt was complete bio-medical task force on wheels built by **Consolidated Diesel Electric Corp.** Six over-sized stainless steel trailers—air-conditioned—were brought to Vandenberg AFB as part of **Lockheed** missile systems division. Two trailers house identical laboratories, another contains altitude simulating chamber, fourth contains telemetry and data processing and the remaining two are service units.

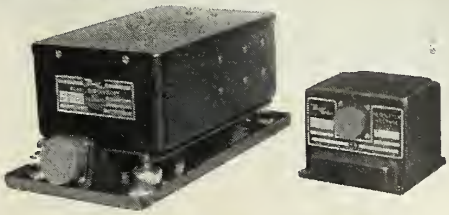
Gladding, McBean Reveals Ceramic Brazing Jig

Brazing jigs from ceramic compositions have been fabricated successfully by **Gladding, McBean & Co.** The Los Angeles firm says the jigs, for use in making rocket motors, are of low thermal conductivity permitting tubes to be thoroughly brazed together. Moreover, the brazing material does not become brittle upon hardening because of too rapid cooling; the ceramic resists being wet by the brazing material; and the jig can be precision formed.



Equally suitable for furnace or torch burning, according to G-MB, the jig's original manufacturing costs are small and it can be used repeatedly because it does not lose its shape.

McDonnell has awarded **Burton Mfg.,** Santa Monica, a contract to produce hermetically sealed longitudinal accelerometers for *Mercury* capsule. Case will include air-damped seismic weight. Movement is transmitted through linkage for visual readout of gravity forces. Instrument has memory indicators showing maximum positive and negative g-forces, and operates over 32-g range.



Closed-die forged turbine wheel 4 inches id and weighing 520 pounds—reportedly the world's largest—has been produced by **Wyman-Gordon** for use in 1500° to 1800°F range from high-temperature nickel-base alloys. Wheel is expected to open up possibility for higher-performance rocket engines.

The National Academy of Science elected as a foreign associate of the Academy Prof. V. A. Ambartsumian—noted Russian astrophysicist and director of the Burakan Observatory in Soviet Armenia. Ambartsumian is the fifth Russian to be named a foreign associate of the Academy. He is the third since the Russian Revolution. First Russian to be so honored was Pavlov.

WHY THE NAVY'S NEW A3J CAN CALL ITS SHOTS IN ANY WEATHER

The A3J—built by NAA-Columbus—is the fastest, most versatile attack plane the Navy has ever known. It can find targets at extended strike range, even if obscured by weather. A3J's accuracy comes from an extremely advanced bombing-navigation system created by Autonetics. It's a system that is ready and reliable today—because Autonetics started working in this field 12 years ago. This experience is available to you now. Please write for detailed information.

Autonetics

A Division of North American Aviation, Inc.,
Downey, California

Recorder Size and Weight Cut

Ampex AR-200 weighs one-third as much and is half the size of previous magnetic tape recorders

by Charles D. LaFond

REDWOOD CITY, CALIF.—The quan- of telemetered data acquired in missile efforts has been increasing ithmically—its complexity is as- ding. Since man's ability to process wealth of information reached an limit, recognition of the great ntial of magnetic recording tape only a matter of time. Its storage bility and its speed make an un- lled contribution to technical data isition. The development of better recording devices and steadily im- ed recording and analyzing tech- s has been continuous.

Almost all phases of missile check- launching, and subsequent moni- g involve the use of magnetic tape ding. Through the use of tape, tive space vehicles have been d the ignominy of failure; scien- theories and carefully engineered ns have been proved; the direc- for optimizing successor space sys- has been revealed; human error e performance of long and tedious ntial control operations has been nized.

ne of the problems associated with etic tape recording equipment in al was the large size and weight isting units, including the mobile Much progress was made in izing performance and increasing ility, but there still remained the y large physical size. In recent there has been steady progress in ing recorder size.

Transistorized model—Comple- ng standard recorders—and pos- the forerunner of future missile- tape devices—is a new airborne/- e magnetic tape recorder devel- by the Instrumentation Division npex Corporation.

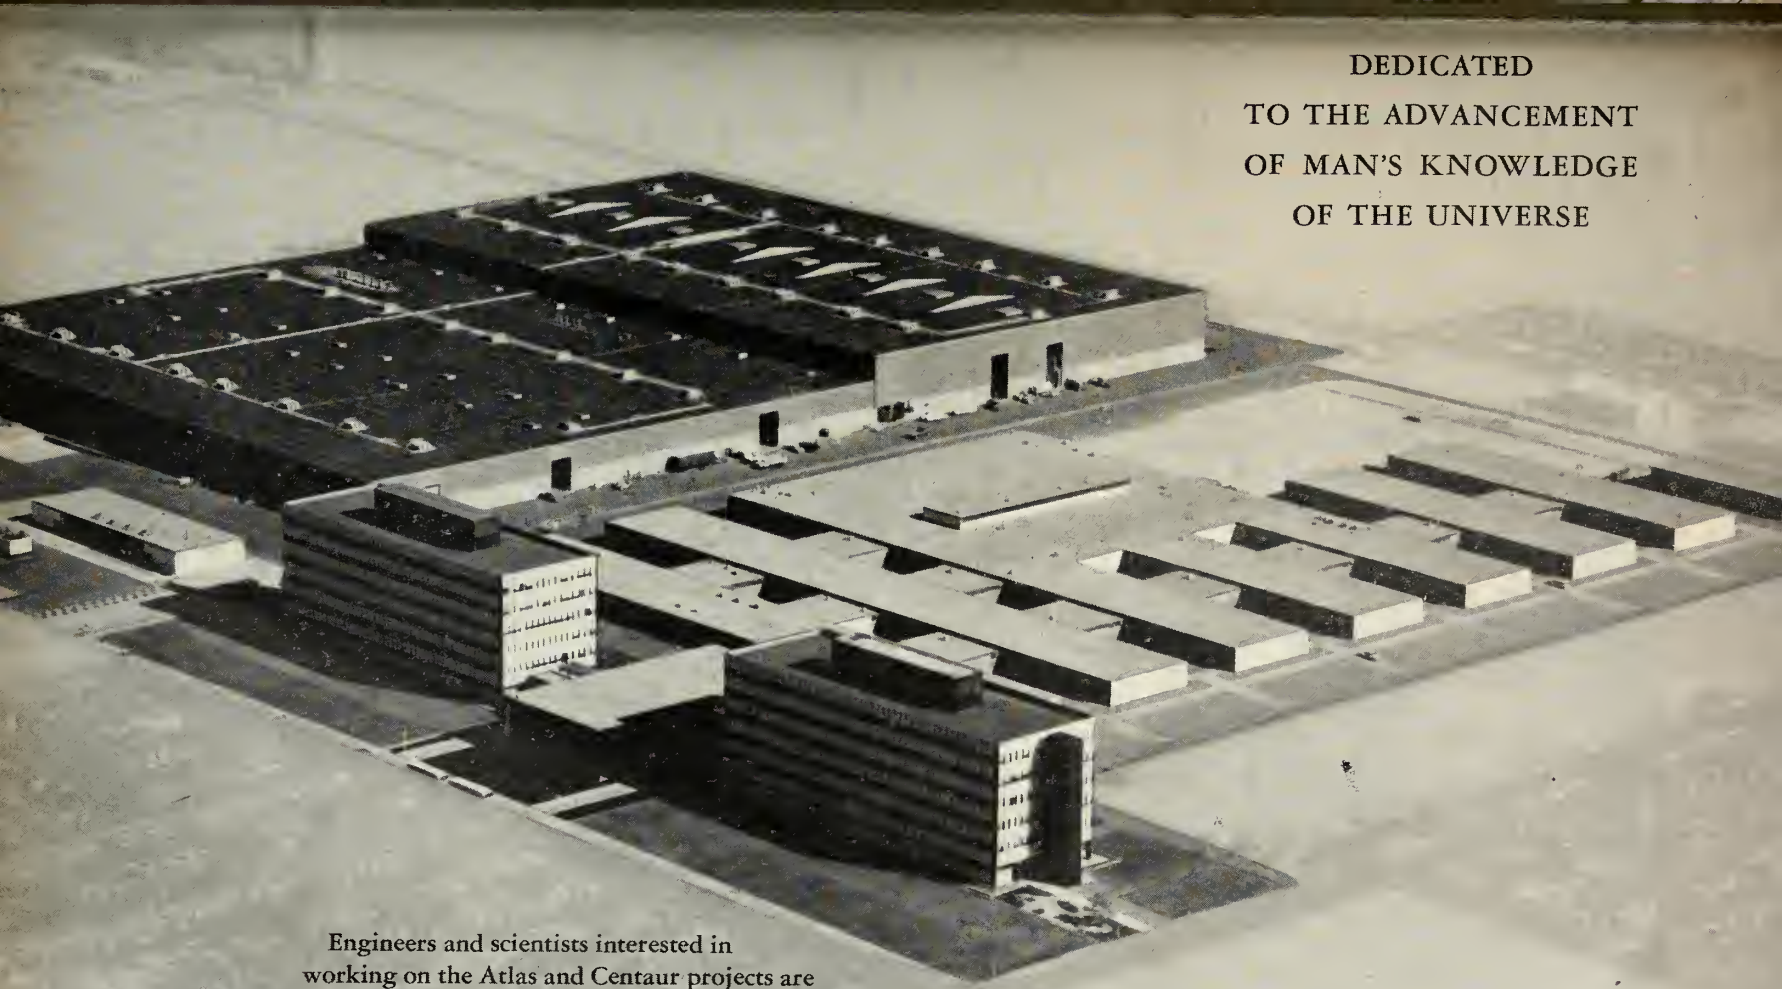
ss than half the size and a third the weight of its predecessors, the system is fully transistorized, employs modular construction, and is fabricated from lightweight metals throughout most of its chassis.

Designated Ampex AR-200, the basic system is comprised of two units: the tape transport and the amplifier housing, in which different interchangeable amplifiers may be installed to achieve particular recording characteristics. An instrument-panel remote-control unit and a test unit (go/no-go type for complete checkout and alignment) are the two principal accessories to the system.

Considered by its developers to be extremely rugged and highly reliable, the tape transport unit utilizes a single-piece cast aluminum chassis and rigid cast cover which can be opened from either front or back, or removed altogether. Total weight is 90.5 pounds.

Although it is designed for normal operation in a lateral position, a change of shock-mount arrangement will permit operation in any position.

In environmental tests, the equipment has shown sustained satisfactory performance under shock tests up to 15gs and vibration to 10gs at altitudes of 10^4 feet, under temperature changes of from –65° to 160°F, and up to 95% relative humidity.



Many diversified factors have entered into the machine's high environmental adaptability. Summarized below are some of the features which combine to give the recorder its resistance to temperature extremes:

- Silicon transistors have been used throughout the system because of their extended operating temperature range (as compared with other available semiconductor materials).
- A special irradiated, thermally-

A COMPLETE airborne or mobile type AR-200 magnetic tape recorder system is shown from left to right: power converter, electronics box, remote control unit, AR-200 tape transport, and test unit. Design includes an alternate-opening transport cover permitting opening from front or back or complete removal. Total weight: 90.5 lbs.

DEDICATED
TO THE ADVANCEMENT
OF MAN'S KNOWLEDGE
OF THE UNIVERSE

Engineers and scientists interested in
working on the Atlas and Centaur projects are
cordially invited to submit a resume for professional evaluation to
Mr. G. N. McMillan, Engineering Personnel Administrator, Department 130-90

CONVAIR | ASTRONAUTICS Convair Division of GENERAL DYNAMICS
5518 Kearny Villa Road, San Diego, California

Table 1. AR-200 Recording Modes and Characteristics

Direct record amplifier (for highest frequency response)	± 1½ db from 50-80,000 cps; ± 1½ db from 50-200,000 cps at constant ambient temp. of 20°C; ± 3½ db from 50-200,000 cps over ambient temp. range of 0° to 75°C
FM-carrier record amplifier (for greatest signal amplitude accuracy)	± ½ db from DC to 10kc at 60 in./sec.
Digital (PCM) write amplifier (for max. number of data samples)	Input rate: 18,000 bits/sec/track (32 tracks—576,000 bits/sec) Transfer rate: 75,000 bits/sec.
Pulse duration modulation (PDM) (for quasi-static variables)	Pulse accuracy: ± 2m sec at 30 in./sec. Pulse length: 50-700 m sec at 30 in./sec.

ilized composition has been used some of the AR-200's electronic ng. The wiring for the power drive plifier is covered with a tough and atile polyethylene base composition. barded with gamma rays during nufacture, it later is exposed a few seconds to a temperature approximately 275°F. This causes material to shrink and form a re-kably tight mechanical bond with wire over which it has been placed. Resistant to chemical acids, bases, hydrocarbon solvents, including tion gasoline and oils, the covering apable of retaining stability under emely adverse conditions. It with-ds temperatures from −100°F to 0°F while maintaining flexibility strength. When subjected to these erature extremes, it will not melt, len, crack, run, or blister, accord-to company engineers.

• **System details**—Six standard tape ds are available: 1⅞, 3¾, 7½, 30, and 60 in./sec. Start and stop s of 0.5 sec. are attained in the transport and the speeds are con-ed by a synchronous motor for fidelity. Reel size is 10½ in. for accommodating ½- or 1-inch magnetic tape widths and up to 3600 feet of tape.

• Magnetic heads—To accomplish the various recording modes for the two tape sizes, improved plug-in, positive-contact surface, magnetic heads have been developed for each track configuration. Inter-track relief areas permit more efficient disposal of tape-oxide accumulation.

In track-to-track phase relationships, time displacement error among all tracks on one headstack is held to approximately 60 μsec. at 60 in./sec. To achieve this precision, total gap scatter for all heads in one stack is held, in manufacture, to 10^{-4} in. or better and azimuth of gap axis to 90°00′ ±1!

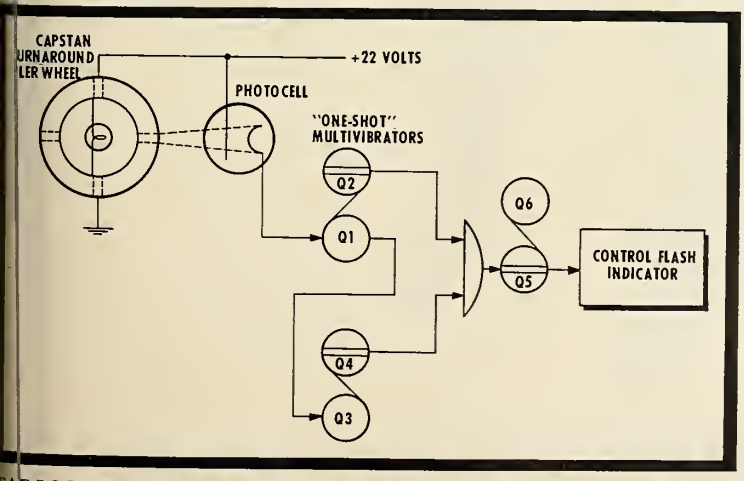
• Power requirements—Because of its designed airborne/mobile mission, the system operates from a 28v dc supply with a total power requirement of 150 watts. By using accessory power converters, other standard ac sources (115v, 400 cps; 208v, 400 cps; 117v, 48 to 63 cps) can be employed.

• Recording modes—Versatility of the AR-200 system is demonstrated in its recording-mode interchangeability. Four basic recording modes can be accomplished by changing the amplifier: direct record, FM carrier, digital, and PDM. (See Table 1.)

From 7 to 32 recording tracks are available, depending on tape width and recording mode. A ½-in. tape will accommodate either 7 analog-recording tracks or 8 digital recording tracks. A 1-inch tape offers 14 analog, 16 or 32 digital, or 16 digital and 7 analog tracks. By employing multiplex techniques, analog tracks could handle over 1000 data channels at one time.

A unique part of the circuitry in the tape transport is the tape speed sensing circuit (or logic circuit). The heart of the successful operation of any magnetic tape recorder is its ability to control its speed. In addition, the operator must be aware of proper performance at all times. The AR-200 employs an indicator light on its control section of the tape transport. Also, the remote control unit contains a similar light.

• Logic circuit—The tape speed sensing circuit located in the tape transport assembly is designed to monitor tape speed when the transport is in the operating mode and permit engagement of the pinch rollers on the capstan shaft only when the tape speed and capstan resolutions are compatible. Components necessary for this function are mounted on a printed circuit board.



A 1-in. diameter turnaround idler on the tape transport has four windows through which light may pass onto a photo-cell. (Refer to the block diagram.)

At a tape speed of 60 in./sec. approximately 80 pulses/sec. are generated by the photo-cell. At a tape speed of 30 in./sec. approximately 40 pulses/sec. are generated by the photo-cell.

The pulse repetition rate represents periods of 12.5 and 25 m sec. respectively, only when the tape is at the correct speeds. Two uni-vibrators operate as coincidence gates that determine the instant the tape is up to speed for pinch roller engagement.

Pulses from the turnaround idler trigger the input uni-vibrator having a time constant adjusted to produce a 5-msec positive pulse for each photo-cell pulse. The negative-going portion of this pulse triggers a second uni-vibrator having a time constant adjusted to produce a 10-msec positive pulse for each trigger signal.

The output pulses from the input uni-vibrator and the second uni-vibrator are fed to a gate circuit clamped at a potential slightly higher than either output. When the tape is not up to speed, with insufficient pulse repetition rate present from the input uni-vibrator, the combined outputs do not over-

AE LOGIC block diagram of the AR-200 Record Indicator and Speed Sensing Device.

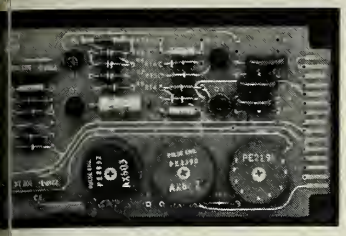
Lightweight Full Pressure Suit developed for U.S. Navy

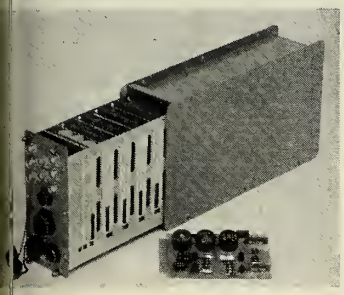
1934 Stratosphere Suit

B.F.Goodrich



At B.F. Goodrich the space age started in 193

That was the year B. F. Goodrich dev oped the first rubber stratosphere flyi suit for attempts at setting altitu records. Through the years this suit h been constantly improved to meet t needs of higher-flying pilots. And wh the first man sets foot on the moon will probably be wearing a modificati of today's B.F.Goodrich Full Pressure Su



B. F. Goodrich engineers are worki in many ways to help man break t bonds of earth—and return safely. Miss nose cones, improved solid fuels, prop lant heaters, missile battery box heate instrument heaters, printed and etch circuits, stronger metal and plastic str tural materials, insulating materials, p cision rubber seals and gaskets, bl fasteners—these are only a few of t items that may help solve *your* sp age problems. For specific R & D inf mation, write: *B.F.Goodrich Aviat Products, a division of The B.F.Goodr Company, Dept. MR-69, Akron, O*

B.F.Goodrich *aviation products*

Circle No. 23 on Subscriber Service Card.

YPICAL fully solid-state and printed it direct-record amplifier consisting f wo stages of amplification and a bias s lator stage. All of the interchangeable h-in boards are installed in a card rack ne housings for seven (analog) or eight ital) amplifiers.

to produce a cumulative output in x ss of the clamping voltage.

As the tape speed increases, a point s eached where the input pulse repe- it n rate is sufficient to permit coinci- e e of a portion of the positive u es. At this instant, the cumulative o ntial is greater than the clamp e ntial. The pulse is steered through o he third uni-vibrator having a long time-constant of approximately 1 second.

With the first pulse steered through, a relay is energized whose contracts complete the circuitry for pinch roller engagement. At the same time, another relay, whose on-off cycle follows the uni-vibrator, is energized and the corresponding contacts complete the circuitry for the panel indicator light to show that correct tape speed has been attained.

While the tape is at correct speed, the light will blink at a rate of approximately once per second. For any other tape condition, it will not blink.

• **Reliability and maintenance**—Flutter, a problem present in all recording devices as a result of the many variations in component velocities, was the object of a long but fruitful design exercise during the development of the AR-200. In the final production model, cumulative flutter is negligible—less than 0.1% (60 in./sec. at a 300-cps cutoff frequency).

With its modular construction and easily removed access panels, all components in the recorder system are easily reached and quickly replaceable. Despite this accessibility, the units are dustproof when closed. All sensitive control and operating areas are sealed with gaskets. (For operation above 71°C a filtered connection is provided for an external cool-air source. The intake and exhaust parts are capped when not used.)

All bearings in the transport unit are life-sealed ball bearings, eliminating the need for lubrication.

ner Van Allen Radiation Belt Identified

IVERMORE, CALIF.—Positive iden- ifi ation of the inner Van Allen belt N R June 8, 1959; p. 11) was made y Drs. Stanley C. Freden and R. St hen White of the Lawrence Radia- ic Laboratory, University of Califor- ni As a result of their efforts, the de ity, flux, and energy distribution of apped particles in the earth's mag- ne field were described for particles pe trating more than 6 g/cm² of ma erial.

A stack of ten sheets of nuclear em lsions, Ilford K.5 emulsion—1⅜ in. x 1⅜ x 600 μ, were hermetically se d in a stainless steel box. This va installed within the nose cone of a *Thr-Able* and secured on the instru- ne t board, 1¾ in. from the side wall. Th plane of the emulsions was parallel o he normal to the wall.

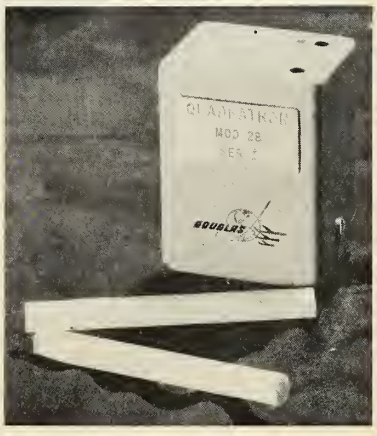
On April 7, 1959, the missile was launched from Cape Canaveral, reaching a 1230-kilometer max. altitude. After travelling for 15 minutes above 1000 km between latitudes 20°N and 3°N, the cone re-entered the earth's atmosphere and was recovered in the South Atlantic. Then the emulsions were returned to Livermore for analysis.

The study of emulsions was limited to the identification of protons with energies greater than 75 Mev and electrons with energies above 12 Mev. An isotropic distribution was assumed since the nose cone was not oriented in space.

• **Results**—No evidence of electrons was observed. The analysis of observed proton energies was indicated roughly as follows: 700 Mev or higher—1%; 300 Mev or higher—10%; the bulk of the tracks were spread between 75 and 300 Mev. An omnidirectional flux, based on the observed data, was computed at 1300 protons/cm²/sec (which is consistent with previous data). Total radiation level at 1200 km altitude was calculated to be 1 roentgen/hour.

• **Conclusions**—Conclusions resulting from the experiment and subsequent analysis were directed by the scientists at the two principal theories concerning the origin of trapped particles in the inner belt: (1) solar injection and (2) earth neutron albedo.

Freden and White stated that the solar origin theory is unable to account for the high-energy protons observed.



But in the neutron albedo theory, neutrons from upper-atmosphere cosmic ray interactions travel to the trapping region and decay into protons and electrons. The scientists believe this theory satisfactorily explains the experimental data, since sufficient high-energy neutrons are formed to provide a quantity of protons comparable to those observed.

Plug-in Computer Matches Systems 700 Times Bigger

EL SEGUNDO, CALIF.—A new miniature plug-in computing unit, called a Quadratron, is a passive non-linear device capable of performing nearly 25 of the basic, commonly used, nonlinear functions. Developed by the Douglas Aircraft Company here, the unit replaces systems 700 times larger and thousands of dollars more costly, said the company.

Designed to deal realistically with nonlinear mathematical factors, the Quadratron is expected to permit a precision not normally achieved in certain practical engineering problems.

First applications probably will be in control systems, automation, analog computing, instrumentation, simulation, and data reduction. Cost will be a few hundred dollars. Douglas has indicated the units should be available to industry later this year.

Radar Is Strongly Defended at AFCEA Convention

by Hal Gettings

WASHINGTON—In contrast to Sir Robert Watson-Watt's statement at the Missile Industry Conference last week that radar is obsolete, consensus of experts at the 13th annual convention of the Armed Forces Communications and Electronics Association here is that radar is capable of doing its job today and in the foreseeable future.

Described as the most successful convention to date, the AFCEA convention had 80 exhibitors and an attendance of close to 4000. Exhibits overran the Sheraton Park exhibit hall into adjoining rooms and the lobby and even onto the lawn. Special events included a tour of the Ft. Meade Missile Master site and a banquet at which Gov. Leo Hoegh, Director of Civil and Defense Mobilization, was the principal speaker.

• **Growth claims**—Speaking in a panel on space tracking, Dr. H. G. Weiss of Lincoln Laboratories said that radar capability had grown with need. He said the problem is definition of requirements, rather than inability to design capable equipment.

Dr. Weiss pointed out that over the past few years the sensitivity of radar had increased 10,000-fold—which yields an increase of ten times in detection range. Present technology allows creditable performance at ranges of several thousand miles. According to Dr. Weiss, a thousand-fold increase in sensitivity is foreseeable in the near future. This would make possible effective ranges of 5-10,000 miles for small targets and up to 25,000 miles for large targets. (The *Atlas* satellite would be considered a "large" target.)

Present radar satellite tracking antennas, with their associated computation facilities, can track a satellite for a few seconds and determine its orbit. Conceivably, such a system could also track a missile for a short period and determine its trajectory—a vital factor in anti-ICBM defense.

Radar development can progress by several different means within today's state-of-the-art: larger antennas, more power, and by taking advantage of low-sky noise temperatures.

Based on present techniques, tracking antennas up to 250 feet in diameter can be built within the required mechanical accuracy tolerances. Fixed multilobe antennas can be built of almost any size. Transmitted power can, of course, be pushed up to practically any reasonable limit required. Since received power decreases as the fourth power of range, receiver sensitivities, too, are especially important. The further development of low-noise parametric amplifiers offer considerable help in this area.

Other interesting aspects of space tracking were reviewed by members of the panel. R. L. Easton of NRL described the southern radar fence for detection of satellites, and Dr. H. L. Richter, Jet Propulsion Laboratory, discussed the facilities for tracking deep-space probes (*Pioneer III* and *IV*) using the TRAC(E) radioastronomy system. The present three probe-tracking stations will be supplemented soon by the establishment of overseas facilities by NASA.

Other systems described included the BRL-ARPA DOPLOC (locked-doppler) satellite fence, the world-wide Smithsonian optical tracking system, Minitrack, and Spacetrack programs.

• **Panels**—Problems and developments in space communications were covered by a panel moderated by Rear Adm. John Clark, of ARPA. Other panels discussed photography, R&D management, and men and machine reliability in space travel.

General Curtis LeMay, AF Vice Chief of Staff, said at the keynote luncheon that "communications could prove to be the 'Achilles heel' of our nation's defenses." He pointed out that communications are lagging behind the needs of our rapidly expanding operational requirements, and called for increased effort, radical thinking, and rapid development of equipment to meet the growing demands.

Examples of needed improvements cited by the General:

• Range extension and improvement in tropospheric scatter systems;

• Improved reliability and security in cryptographic devices for voice, data, and pictures;

• Increased speed for teleprinter communications—up to pages per minute;

• A reliable worldwide voice capability.

ARMY MOBILITY AND FIREPOWER NEW VOUGH STUDY AREA

Chance Vought has taken the vol teer's pace forward to work with Army in an important mission . . . bri ing new techniques to an ages- defense area – the battlefield.

For 42 years a developer of high-p formance aircraft and strategic missi this company has sharpened its fo on the needs of the new Army.

On its own initiative, Vought has gaged in new study and developm programs to meet requirements of Army of today and tomorrow. One concept, still classified, was tested e in 1959 at the Army's Redstone Arse

Design philosophies and an organ tion tailored to development of advan aircraft and superior missiles are be adapted to the battlefield needs of t mobility and devastating firepower.

Vought's talents will continue to be rected toward fulfilling the requirem of our modern Army.

Advanced weapons is just one in broad spectrum of Chance Vought f of activity. Other areas include: de and production of high-performa aircraft, astronautics, electronics, submarine warfare, range syst management, commercial process trol systems.

CHANCE VOUGHT DALLAS, TEXAS

STRAC STRIKES !

They left in 30 minutes. With them went field kitchens, mortars, new battlefield missiles, barracks bags. All went aboard swift transport planes and headed for trouble 4,000 miles away. They arrived the same day, for this is a battle group of the Strategic Army Corps – world's most mobile army and our "defense on the double" against limited war. STRAC's kind of war has flared 18 times since V-J Day. STRAC's mission is to put out these "brushfires," or keep them from spreading. By quickening U. S. reaction to limited war, this crack Army corps helps lessen the prospect of global war.

ADVANCED WEAPONS · ASTRONAUTICS · ASW · ELECTRONICS · MISSILES AIRCRAFT · G · RANGE SYSTEMS

CHANCE VOUGHT DALLAS, TEXAS

SPACE ORIENTED ELECTRICAL ENGINEERS AND PHYSICISTS

Vast new space and missile projects have created outstanding opportunities in research, development and design at Douglas. Here are some of the areas in which we have immediate openings for engineers and physicists with advanced degrees (B.S. also considered):

SPACE NAVIGATION — Utilize Bode and Nyquist techniques, root loci, Z plane, quasi linear, non-linear and other techniques in the analysis and development of guidance and control systems.

SPACE COMMUNICATIONS — Telemetry system research and development, research in wave propagation in ionized gas, high frequency breakdown and many other areas.

SPACE POWER — Unconventional power research and development to supply power in space stations and on other planets.

LOGICAL DESIGN — Solid state digital circuits as applied to automatic test and firing equipment, utilization of complex switching and logic circuitry, and utilization of computers in detailed circuit design.

ANTENNA DEVELOPMENT — Complete research, advance design and development of antenna and radome systems for use on space vehicles.

For full information write to Mr. C. C. LaVene, Staff Asst. Vice-president, Engineering, Box 620-R, Douglas Aircraft Company, Inc., Santa Monica, Calif.

DOUGLAS

The most respected name in aircraft, missile and space technology.

PHOTOCON ELECTRO-MAGNETIC COUNTERS

—compact, reliable units for telemetering readout and control

These Photocon counters add and/or subtract electrical pulses at speeds up to 20 counts per second. Each digit on each wheel has a contact, for remote indication or control. Counters available with precision resistors mounted between contacts. Counter provides an analog or digital output.

High accuracy—there is no gain or loss of counts over a life of 10,000,000 counts. A balanced armature insures accurate counting during severe vibration.

High reliability—contacts are made from precious metals to eliminate contact noise. Wearing parts are built of Nylon for long life.

Small size—only 1 13/16" high x 3½" wide x 3¼" deep. Weight is only 22 ounces. Available in 3-, 4-, and 5-digit counters...also in shaft-driven models. Units can be preset, and hand reset. Write for literature on Photocon Model MCP-1005.

KISTIAKOWSKY

George B. Kistiakowsky, a Russi born Harvard ch istry professor, been named by President to succ **Dr. James R. K lian** as special sistant for scie and technology. K lian resigned M 28th "for com ling personal r sons." He will turn to the Massachusetts Institute Technology, where he was president u his appointment to the scientific advis post in November, 1957.

Kistiakowsky, 58, became a natu ized citizen of the United States in 19 after emigrating from Russia where fought against the Communists in White Russian Army from 1918 to 19 He was a member of the National A demy of Sciences' Atomic Energy Co mittee as early as 1941 and chief of Los Alamos Laboratory's explosives di ion in 1944-45. He also headed seve wartime projects sponsored by the N tional Defense Research Committee.

In accepting Killian's resignation w "very sincere regret," the President e phasized "the vital importance" of work to the future security of the Uni States.

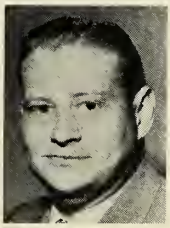
Killian, whose resignation is effect in mid-July, leaves what has, in the l two years, become one of the most fluential positions in government. (S M/R, Dec. 22, 1958, pp 22, 23.)

WICKERSHAM

Robert O. Wickersham has been pointed director of Space Technology Laboratories, Inc.'s program management staff, Systems Engineering Div. Prior to joining STL in 1956, Wickersham was manager of military sales for Lockheed Missile Systems Division. From 1951 to 1953, he was assistant the vice president for engineering at B Aircraft Corp.

C. Robert Shaeffer was elected sec tary-treasurer of American Electro Laboratories, Inc. **Raymond S. Marl witz,** a senior engineer of the compa was elected assistant secretary.

The Board of Directors of Gene Applied Science Laboratories, Inc., nam **B. J. Driscoll** to the newly created p tion of vice president-general manag Driscoll comes to GASL from the N tional Academy of Sciences-National R search Council, where he was associ director of a special study of long-ra research and development trends of terest to the Air Force. He has h executive positions at the M.I.T. Linc Laboratory, the NATO Advisory Gr



f Aeronautical Research and Development, and the Air Force Scientific Advisory Board.

HEBENSTREIT

William B. Hebenstreit has been named program director for communication satellites, Systems Engineering Division, of Space Technology Laboratories, Inc. He once was director of special programs for the Systems Engineering Division, and prior to that he headed Ramo-Wooldridge Corp.'s Computer Systems Division.

Maj. Gen. Otis O. Benson, Jr., Commandant of the Air Force School of Aviation Medicine, has been named president of the Pan American Medical Association's section on Space Medicine. **Dr. S. Fred Singer,** professor of physics at the University of Maryland and contributing editor of M/R, was named secretary.

LEWIS

David E. Lewis becomes assistant manager, applications engineering at Electronics, Borg-Warner Corp. A former USAF officer, Lewis headed the on-board recorder section, missile test track, at Holloman Air Force Base.

The National Academy of Sciences-National Research Council has announced appointment of a 14-man committee on the Scope and Conduct of Materials Research.

Dr. Clyde Williams, President of Clyde Williams and Co. of Columbus, Ohio, is chairman of the Committee. A former president and director of Battelle Memorial Institute, he served as chairman of the War Metallurgy Committee of the Academy-Research Council during World War II. Other members of the Committee are **Dr. Allen Astin,** director, National Bureau of Standards; **Dr. Harvey Brooks,** dean of Engineering and Applied Physics, Harvard University; **A. J. Herzig,** president of Climax Molybdenum Co. of Michigan and chairman of the Materials Advisory Board; **Dr. A. B. Kinzel,** vice president, Union Carbide Corp.; **Thomas H. Miller,** assistant director, U.S. Bureau of Mines; **Dr. John D. Morgan, Jr.,** consultant, Washington, D.C.; **Dr. Thomas B. Nolan,** director, U.S. Geological Survey; **Dr. Albert J. Phillips,** vice president, American Smelting and Refining Co.; **Dr. C. F. Rassweiler,** vice chairman of the board, Johns-Manville Corp.; **E. Duer Reeves,** executive vice president, Esso Standard Oil. Co.; **Professor Frederick Seitz,** Department of Physics, University of Illinois and chairman of the Committee on Perspectives in Materials Research; **Professor Cyril S. Smith,** Institute for the Study of Metals, University of Chicago, and **David Swan,** vice-president-Research, Lithium Co.

Aeronautical wind tunnel located at University of Michigan

FOR A SCIENTIFIC CLIMATE...

There's a devotion to creative thinking that you sense the minute you walk through the front door of the Bendix Systems Division.

Located in Ann Arbor, Michigan —a university town with big city advantages—you may enjoy all four seasons to the fullest. The year-round sports and outdoor recreation mean fun for you and your family. Within the buildings that house the Bendix Systems Division, the climate is scientific all year 'round.

If you are an able engineer or scientist seeking to apply your imagination and ingenuity to the problems involved in developing new weapons systems, you will enjoy the scientific climate at Bendix Systems Division.

If you are interested in doing advanced study, you will find the University of Michigan's fine Engineering College next door. Bendix encourages you to take advantage of this opportunity by attending daytime classes.

For information on a career in systems research and development, as well as a better way of life, you are invited to write for our new recruitment brochure. Bendix Systems Division, Dept. K6-15, Ann Arbor, Michigan.

west coast industry . . .

BY FRED S. HUNTER

Youngest corporation president . . .
in the industry is Tom Jones, Northrop Corp.'s new chief. At 39, Jones is two years younger than Donald Douglas, Jr., who previously held this distinction. Jones is highly regarded, both as an engineer and company executive. He has vision, a quality that's very important in today's product competition. In this connection, keep your eye on Northrop developments in boundary layer control.

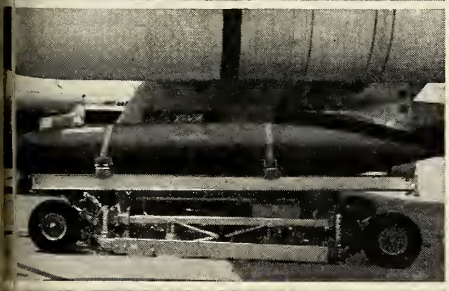
There's another Tom Jones . . .
who is president of a company in the industry, Thomas Roy Jones of Daystrom, Inc. On the coast not long ago, Jones observed his company is likely to lose money on its Daystrom Systems division in San Diego for the next three years. But he looks for a fine future. One of the Division's newest products is a 2000-point monitoring system for tests of a nuclear aircraft engine.

Fast-growing Daystrom, Inc., which had sales of $81,713,986 in Fiscal 1958, is shooting for annual sales of $200 million five years from now. "We hope to do it through internal growth and some acquisitions," said Jones. And to insure future growth, Daystrom this year will spend about 10¢ of every sales dollar on research, of which 4¢ will come back from the government.

Cost of an *Atlas* ICBM . . .
was estimated at $10 million during Senate hearings this spring, and ever since this has been the generally accepted figure. Convair's portion, however, comes to something under $2 million. This represents the cost of producing the missile frame and assembling the complete *Atlas*. It does not include the cost of engines, guidance system, nose cone or nuclear warhead. These are government-furnished. Only figure ever made public about the cost of nuclear warheads was $240,000 for a warhead for the Douglas *Genie*, an air-to-air rocket. *Atlas* warhead, of course, would cost much more. Launching sites also add up to a pretty penny. It's when you crank in all these costs that you get to $10 million.

Lockheed surveyed Santa Barbara . . .
before finally deciding the Newport Beach area would be a better location for the general and engineering offices of its new Electronics and Avionics Division. Newport Beach is closer to such soul-satisfying attractions as the Dodgers and Disneyland and this is an important factor to employment managers. It may be a couple of years, however, before the move is made since the Maywood plant provides an ample temporary facility.

The Air Force ALBM award . . .
to Douglas is a six-months development contract after which the government can take another look. The Air Force wanted to award a production contract on the ALBM, but William M. Holaday, Department of Defense director of guided missiles, decided it would be wiser to take a more conservative approach. There's little doubt that the Douglas contract will be extended into production. Support for the mobile platform concept keeps growing.



Aeronutronic Systems, Inc. . . .
the Ford Motor Co. subsidiary, is developing computer components that are 10 times as fast as those currently in operation. Computers with "learning" capabilities is another project. People learn by trial-and-error methods. "Why not a computer system which detects errors and corrects them?" says Dr. Ernest H. Krause, vice president and general manager of Aeronutronic's computer and range systems division.

...NEWS IS HAPPENING AT NORTHROP

For the Hawk missile, Nortronics supplies Raytheon Manufacturing Co. with the loaders, launchers, and auxiliary handling equipment. Throughout concept, design and production, Nortronics has kept this program on – or ahead of schedule.

Shown above: Northrop's T-38 Talon, F-89 Scorpion and SM-62 Snark – all served by Nortronics' mechanical, electronic and servo-hydraulic GSE applications.

NORTRONICS TOTAL GROUND SUPPORT – KEY TO DEFENSE READINESS!

By integrating mechanical, electronic and servo-hydraulic skills into a wide variety of ground support equipment applications, Nortronics demonstrates an understanding of the total weapon system.

Nortronics conceives, designs and manufactures GSE around a knowledge of the weapon's mission, its operational and maintenance concepts, and the facilities and skills of its field operators.

Twenty years of specialized experience gives Nortronics the ability to get the job done – to translate your most complex GSE requirements into reliable hardware – on time – and at minimum cost.

For immediate help with your GSE requirements, call Nortronics today. Or write: Chief Applications Engineer, Dept. 2003-G3, Nortronics, 500 E. Orangethorpe Ave., Anaheim, California.

high temperature
PLASTICS

Continuing research in the field of high temperature plastic molding has enabled Olympic to create fiberglass missile components such as nose cones, radomes and heat reflective shields.

High strength, heat resisting structural parts and exhaust deflectors, insulators and nozzles have been produced that perform as high as 5000° F.

Standard electrical terminal strips now adopted as NAS 1066, as well as special design terminal blocks, have been developed to withstand continuous service to 600° F.

propulsion engineering

New high-temperature material . . .

Carborundum Company offers for nozzles and nose cones combines advantages of both silicon carbide and graphite—and each cancels the other's disadvantages. Silicon carbide has excellent erosion, oxidation, and heat resistance characteristics. Thermal shock resistance is good, but not good enough for many missile applications. Graphite, on the other hand, offers only fair erosion resistance and poor oxidation resistance. However, graphite has outstanding thermal shock resistance.

The new material consists of small graphite particles embedded in a dense silicon carbide matrix. The SiC shields the graphite which absorbs uneven expansion. Carborundum calls the material GRB silicon carbide. It can be tailored to meet different uses by changing the composition. Carborundum says thermal shock and erosion resistance over the full range of compositions—20% to 45% of graphite by weight—is excellent. However, generally speaking, maximum erosion and oxidation resistance comes in low graphite compositions. Thermal shock reaches a max in the high graphite compositions.

Physical properties of GRB SiC of interest to missile makers:

Thermal conductivity, high of 700 BTU/°F at 400°F down to 350 BTU/°F at 1600°; coefficient of thermal expansion, about 2.70 inches/°F over the range 70° to 2460°F, controlled by varying the SiC matrix; density, controlled by graphite composition, 2.3 to 2.8 grams/cm^3; flexural strength over a wide temperature range is "much higher" than that of standard graphite bodies.

Nozzle and nose cone shapes . . .

machined from GRB SiC have passed tests with flying colors. Carborundum says: "In highly erosive environments, under conditions of extreme thermal shock and temperatures in excess of 4500°F, this composite body of silicon carbide and graphite has consistently shown negligible or minor erosion and no evidence of thermal stress failure."

Almost any shape can be fabricated from the new high-temperature material. The free graphite bodies can be machined to tolerances of plus or minus 0.010 inches, the high free graphite bodies within 0.015 inch. By diamond grinding, it's possible to come within 0.003 inches of specification. At present, Carborundum says, fabricated sizes of GRB are limited to about 13 inches to 20 inches. However, a company official says larger sizes will be available soon.

The material will be turned out in a new plant getting under way at Niagara Falls. The $750,000 facility will be a pilot plant, but it will produce GRB at a commercial rate. Other products to come from the new plant, due on stream about the turn of the year, include boron nitride and a KT grade silicon carbide.

Here's a safer method . . .

of melting reactive metals. U.S. Bureau of Mines researchers have developed a way of reducing the risk of explosion that accompanies melting of zirconium and other reactive metals. They use air-cooled molds to catch the molten metal. The Bureau says some explosions have occurred in plants where water-cooled molds have been used. In studies at the Metallurgical Research Laboratory, Albany, Ore., Bureau scientists found that the air-cooled molds offer "a significant reduction in explosion hazard" and will perform as efficiently as water-cooled molds. The technique is applicable also to titanium, columbium, tantalum, and hafnium. Full details are available in Report of Investigations 5443, "Air Cooled Crucibles for Cold Mold Arc Welding." Write: U.S. Bureau of Mines, Publications Distribution Section, 4800 Forbes Avenue, Pittsburgh 13, Pa. The Bureau gives credit for the development to physicist M. M. Kirk and electrical engineer P. C. Magnusson, both with the Albany lab, and G. L. Schmidt, former Albany engineering aide who is now with Atomics International.

EW ROCKET BLAST PROTECTION — by Swedlow

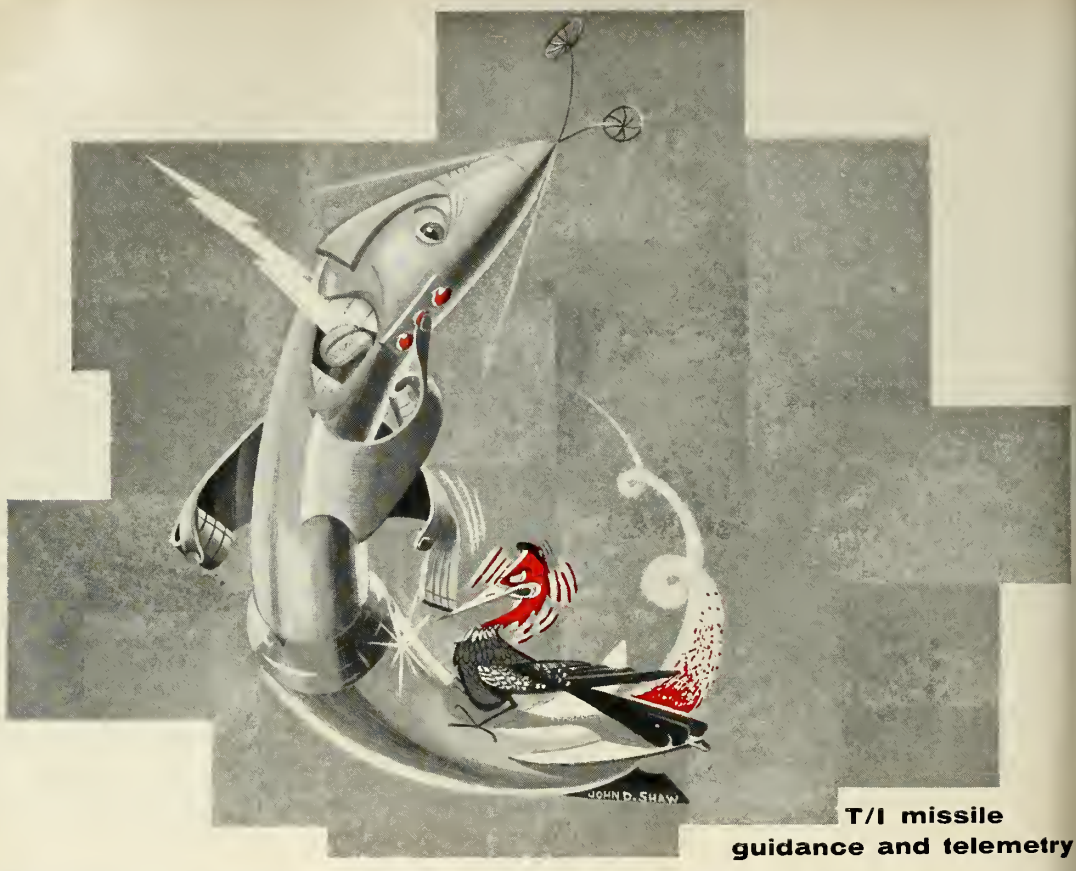
w a ative/insulative wrapping by Swedlow protects Atlas missile nch tubes from direct rocket blast up to 5000°F. The materials and thod developed to meet this extreme demand hold great promise for ny ther applications requiring resistance to elevated temperatures.

To m t the rigid standards for this CONVAIR missile Swedlow has velo l methods of:

(1 Impregnating a refractory silica fabric with a Swedlow modified high temperature phenolic resin, and

(2 Covering the ¼" to 1" tubes and pressure vessels shown above, by tension winding with augmented pressure—a highly skilled operation, and

(3) Special heat treating or curing for maximum shock temperature resistance.



Here is another of Swedlow's contributions to industry, including high temperature resistance welded honeycomb core products, high temperature materials, heat reflective laminates, stretched acrylic transparent glazing materials and others.

Write for technical bulletin "S" entitled "High Temperature Phenolic Laminates." Please refer to Dept. 21.

reviews

EDICAL SCIENCE AND SPACE TRAVEL,

illiam A. Kinney, Franklin Watts Inc., ew York, 149 pp., $3.95.

One of the generally overlooked areas f space research is the medical pro- ssion's attempt to fit man into the space nvironment. Though such research repre- nts only a small part of the $7 billion issile and rocket industry, it holds the ey to the industry's ultimate goal—flight space.

This book is a narration of the air nd lab experiments presently being con- ucted by flight surgeons. Weightlessness, iet and solitude, radiation, meteors, and mperatures of outer space are some of e problems discussed, with conjecture to what some of the eventual solutions ay be. An interesting analysis of man's tempt to chart his unknown reactions the totally alien environment of spacc.

IGH ALTITUDE AND SATELLITE ROCKETS,

he Philosophical Library Inc., New York, 6 pp., $15.00.

A compilation of papers given at a e-*Sputnik* symposium on British high- itude and satellite rockets by the Royal ronautical Society, the British Inter- anetary Society, and the College of ronautics. The papers are by both nerican and British experts in the vari- s areas of rocket research.

WASHINGTON—The May issue of U.S. *overnment Research Reports* lists a mber of reports of interest to the ssile industry which are available to the blic. Subjects include Astronomy, Chem- ry, Earth Sciences, Engineering, Engines d Propulsion Systems, Materials, Me- anics, Nuclear Physics, Physics, Radia- n, and others. The monthly listing may obtained from the Dept. of Commerce, U.S. Government Printing Office. An- al subscription fee is $6.

WASHINGTON—Two articles of partic- ar importance to the missle industry ear in the April issue of the monthly val Research Lab report of progress.

The first describes in detail the tech- ques and equipment used in the first ccessful photography of the solar disk radiation from the Lyman-Alpha line of drogen. The March flight of the *Aero- b-Hi* rocket climaxed four years of ort to get such photographs.

A second article describes the com- te data-reduction system (ARRF) used reduce *Vanguard* telemetry data. The tem, one of the fastest and most pro- ssive of any missile program to date, s completed in 1958 and has been nificantly successful in operation.

The report also contains notes on the gress of various unclassified NRL re- rch studies now under way.

A candle in a dark room?

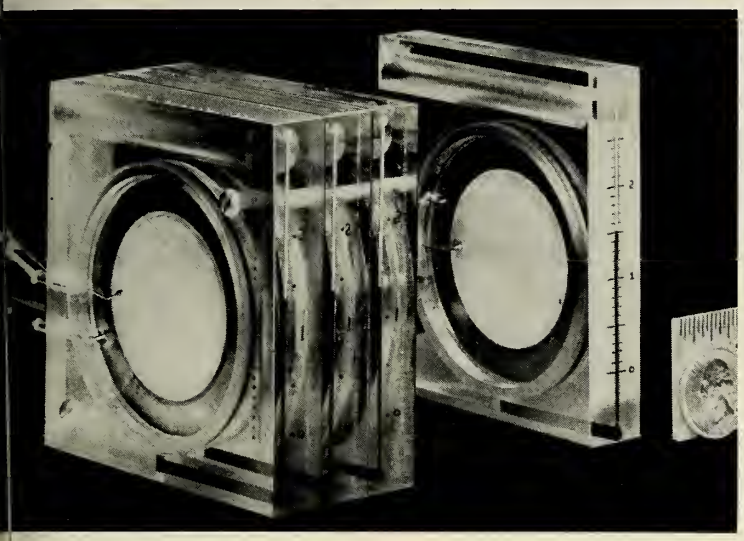
Transverse and/or Visible electromagnetic waves?

A universal constant?

How many wave lengths in a photon?

Is light affected by gravity?

A full appreciation of light and all its phenomena is essential to the successful completion of our energy conversion mission.



We use this knowledge constantly—as, for example, in our recent development of a photo-voltaic conversion system and a mechanical-optical system to convert light energy to electrical energy.

To aid us in our inquiries we call on the talents of General Motors Corporation, its Divisions and other individuals and organizations. By applying this systems engineering concept to new research projects we increase the effectiveness with which we accomplish our mission—exploring the needs of advanced propulsion and weapons systems.

Energy conversion is our business

Electrostrictive Discs Measure Voltage

Prototype models of a new type of cage meter have been built by the **Electronics Department, Mullenbach Division, Electric Mfg. Co.,** using electrostrictive ceramic discs as the dynamic moving elements.

Each meter consists of a small transparent block enclosing two opposing metal discs on which smaller discs of white ceramic have been bonded. Each ceramic wafer is coated on both sides with silver frit, forming a capacitor. When an electric potential is applied, the ceramic contracts, cupping the metal disc.

Colored fluid contained in the reservoir between the two plates is forced to rise in a capilliary tube at the front of the meter, providing a visual indication of the voltage being measured. A surge chamber at the top of the block prevents the building up of back pressure.

The prototype models constructed by Mullenbach measure less than ¾ths of an inch in width, allowing a number of units to be mounted in the space normally required by a single voltage meter of conventional design. Even smaller units could be built, following the same basic concepts.

The new electrostrictive ceramic that makes possible the new meter design is the result of Mullenbach's continuing research in the field of ceramic materials for electronic applications.

Split Rotor, Solid Bar Gimbal Gyro Ready

Clary Dynamics has announced the production of a split rotor, solid bar gimbal gyro which combines accuracy with economy.

The spring wound gyro is designed for use in small, short range missiles and drones.

The two-axis Clary instrument will resist shock to 100 G's, acceleration to 10 G's and vibration to 10 G's while attaining drift accuracies of 0.1 degrees per second.

An uncaging method cuts total time to speed and uncage to 0.1 seconds maximum. The optimum performance running time is 4 minutes with an 8 minute rundown time. The gyro may be kept in wound condition indefinitely

and may be rewound and used as many times as required without loss of accuracy.

The flexible design is said to offer a choice of resistive, commutator or selsyn pickoffs for custom specifications.

Strain Gages Feature Rosette Shape, Minature Size

Three high accuracy MetalFilm strain gages are going into full production at **Tatnall Measuring Systems Co.,** a subsidiary of **The Budd Co.**

The gages are tiny. The smallest one measures 1/32 in. wide, 5/32 in. long and 1/1000 in. thick; the largest is 1/2 in. square and also 1/1000 in. thick. Weight of the gages ranges from 1.1 mg. (.00003883 oz.) to 9.3 mg. (.0003282 oz.). Two of the three gages are fully temperature-compensated for four alloys.

Features of the three gages are: rosette gage to determine magnitude and directions of principal strains;

miniature gage for use in areas of very steep strain gradient; high fatigue life gages for structures undergoing severe dynamic strains.

Rosette MetalFilm gages (top, left), whose geometry is of the three-gage, 45° type, are generally used for determining the magnitude and directions of principal strains.

This gage, designated 121 R3A, is temperature-compensated for four alloys; steels, 19.8 stainless steels, magnesium alloys and aluminum. A prefix before the gage designation specifies for which alloy a particular package of gages is intended.

Rosette gage specifications include resistance of each section—120 ohms; resistance tolerance of each section—± .2 ohms; gage factor tolerance—± .5%; length of each gage section—1/8 in. All gages are epoxy-backed and

at least 1/16 in. of border material is supplied on all sides of the rosette pattern. Reference marks on the gage establish two center-lines to bisect the pattern, which is symmetrical in both planes.

Miniature Metal Film gages, (bottom, left) with a working area only 1/32 in. long, are being produced for use in very steep strain gradient areas such as exist around fillets, cut-outs or holes.

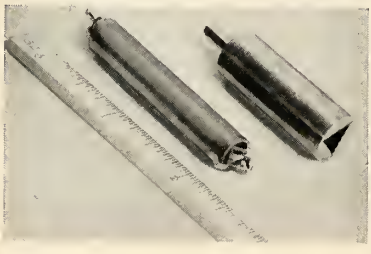
Designated 1X1-321, this miniature unit incorporates the same four-alloy temperature compensation feature as the 121-R3A rosette gages.

Specifications for the 1X1-32A gages include: resistance—60.0 ohms; resistance tolerance—±.2 ohms; gage factor tolerance—±1%. All gages are epoxy-backed.

Dynamic strain measurement Metal Film gages (top, right) has a fatigue life 5-10 times that of an equivalent gage made of advance alloy.

Dual advantages of the gage are: high gage factor (approximately 3.2) and maximum endurance limit.

Tatnall's dynamic strain measurement gages are manufactured from an iso-elastic type alloy and have been designated the 301 series; they cannot be supplied in temperature-compensated types. The 301 series are not recommended for static measurement because of their high positive temperature coefficient.



Specifications for the type 341-500 gage in the 301 series include: resistance—500 ohms; resistance tolerance—±1 ohm; gage factor tolerance—±.5%. Dimensions of the gage are ¼ in. square excluding tabs. The 301 series are also epoxy-backed and can be applied with the same standard technique used for Tatnall's 101 series MetalFilm gages.

Current Sensitive Relay Can Withstand 100 G's

A current sensitive relay of the "Powrmite" micro-miniature relay series has been produced by **Filtors, Inc.**

Known as the "S" type, this new

addition to the rotary "Powrmite" series meets shock tests of 100 G's for 11 milliseconds and vibration tests of 10-55 cps @ .06 double amplitude, 55-2000 cps @ 30G's.

Other specifications: contact arrangement: 2C (DPDT); ambient temperature range: −65°C. to 125°C., dielectric test: (at sea level) 1000V. (750 V. between open contacts); contact rating: 2 amps resistive; pull-in time: 5 milli-seconds maximum; drop-out time: 5 milliseconds maximum; 0.5 oz. maximum weight. Coil resistances from 185 to 10,000 ohms are available as standard values.

Portable Device Measures Nonmagnetic Metals

A new portable eddy current instrument has recently been made available by the **Magnaflux Corporation.**

By accurately measuring electrical

conductivity, the battery-powered Magnatest FM-110 Conductivity Meter performs a variety of testing jobs, including the determination of hardness, alloy, and heat treat condition; sorting mixed nonmagnetic metals; checking tensile strength of aluminum; investigating fire damage to aircraft, and many others. Readings can be taken on a comparative basis using known samples, or in absolute electrical conductivity units as a percent of the International Annealed Copper Standard.

The FM-110 induces eddy currents within the test piece by means of a ½" diameter hand-help probe. These currents affect the impedance of the probe coil as a function of the conductivity of the material. With the probe on one side, the large knob is turned to zero the meter and conductivity is read on the left-hand scale.

This compact 3⅜" x 8¾" x 6 instrument, weighing only 4½ pou can be used for both product and on-site testing. Total range 8% to 107% I.A.C.S., with an curacy better than ± 3% of sc reading, and usually better than ± when used on a comparative basis.

Three volts from two stand flashlight batteries power the self-c tained unit. A built-in battery chec indicates whether the batteries m the required operating voltage ran

Low-Cost Chemical Pump Produces High Vacuum

A simplified titanium getter pump utilizing the chemical react between gases and titanium vapor produce vacuums in the 50 micror 1 x 10^{-9}mm Hg range has been veloped by engineers at **NRC Equ ment Corp.**

Said to cost less than 25% as m as equipment previously availa the pump has applications in resea testing and production when it is ne sary to avoid even a trace of b streaming fluids that might cont nate a vacuum chamber, and/or w it is desirable to pump down and m tain either an open system or a cl chamber, such as a demountable t at high vacuum for long periods.

The unit consists of a stainless s cartridge 7⁵⁄₁₆ inches long and than ½ inch in diameter. Inside tungsten filaments overwound titanium wire. When the cartridg connected to a source capable of plying 60 amp, 3 volt power, titanium is vaporized and form highly reactive layer on surroun surfaces.

A large percentage of the gas m cules striking this layer are abso and chemically bound. Thus, pum is accomplished by gettering. The no pump fluid to contaminate chamber that is being evacuated, periodic firings of the filament sufficient to maintain a high vac in chambers with slow out-gassin materials or slight in-leakage of

The frequency of firing depend

Armco PH 15-7 Mo Stainless elected for the B-70 Valkyrie and F-108

It's the primary sheet metal for construction of newest air weapon systems being developed and built by Los Angeles Division of North American Aviation, Inc.

he B-70 Valkyrie and the F-108, Mach 3 aircraft sig ed for 70,000 ft. altitudes, will add powerful ng range weapons to America's air armor. Both the ar tically-new intercontinental bomber and the in- rc tor being created by North American, in col- bo tion with a team of major defense firms, are to constructed primarily of stainless steel.

Because Armco PH 15-7 Mo Stainless maintains its rength at the high temperatures caused by speeds ceding 2000 mph, it has been specified for the major rts of the airframes.

This special stainless steel, in foil and sheets, will be fabricated into high strength, honeycomb panels for wings, fuselages, and control units. It will also be used for other key structural elements of both aircraft.

Selection of Armco PH 15-7 Mo, newest of Armco's widely used family of precipitation-hardening stainless steels, demonstrates the superiority of this high strength, heat and corrosion resistant metal. For complete information on the properties and fabrication of Armco PH 15-7 Mo Stainless Steel, write Armco Steel Corporation, 2539 Curtis Street, Middletown, Ohio.

the system. The longer the power is applied, the more the titanium that is vaporized and the greater the pumping action—up to, the design limits of the pump. Unlike that of mechanical or diffusion pumps, the action of the titanium adsorber cartridge continues after the filament is turned off.

Pumpdown speed is approximately 5 liters per second. Pumpdown times are dependent on the size and nature of the chamber, sealing method and bakeout and other operating techniques.

Filament life is about 500 evaporations of 1 minute, or equivalent, at 1 micron or less, based on tests to date. A complete filament assembly can be replaced in less than 2 minutes and new filaments can be overwound with titanium wire in under 5 minutes.

No provision for ionization is required. Essentially all of the pumping is by gettering action.

The pump may be used directly following mechanical pumping to the 10 micron level or below.

It can be used following pumping by trapped oil or mercury diffusion pumps or molecular drag pumps where pressures in the 10^{-4} or 10^{-5} mm range are first attained.

In either case the volume to be evacuated, including the titanium pump, is completely isolated by UHV valves or seals prior to final pumping. With suitable initial pumping and bakeout, and careful technique, pressures in the 10^{-9} mm range are attainable and these can be maintained by intermittent evaporations of short duration at increasing intervals.

mic Capacitor Touted place Paper Varieties

kard Bell Electronics announces application on a new capacitor olutionary design which is ex- to eventually replace most paper ors in the .01 and .25 micro- ange and mica capacitors in no-

drift capacities of 300 micro-microfarad to .01 microfarad.

The capacitor is made of ceramic in two forms: extruded and molded. The extruded model is a tube with a triangular cross bracing which performs double duty as a structural core and as a surface area to increase capacitance. The molded type is of solid construction which may be manufactured automatically in one piece without the use of leads or terminals. Both types are suitable for high temperature. The molded type is capable of withstanding extreme temperatures due to its elimination of soldered terminals.

In the 300 micro-microfarad to .01 microfarad range a no-drift capacitor can be made for values of NPO up to N6000 for temperature compensation. The capacitors are non-inductive and have indefinite life since no active elements are used in their manufacture. They reduce mounting area, cost and installation time, and are suitable for printed circuitry and dip soldering techniques without price penalty.

Circle No. 235 *an* Subscriber Service Card.

Transducer Measures Pressures to 10,000 psi

A precision pressure transducer designed to measure gauge or absolute pressures in the 100-10,000 psi range and give exceptionally high performance under severe environmental conditions was announced by the Components Division of **Fairchild Controls Corporation,** a wholly owned subsidiary of **Fairchild Camera and Instrument Corporation.**

The Model TPH-175 is a dynamically balanced pressure transducer which employs twin spring linkage to eliminate pivots or bearings thereby eliminating friction points and giving the unit excellent repeatability characteristics.

The pressure sensing elements are twin bourdon tubes which actuate the wiper of a precision wire-wound potentiometer giving either linear or nonlinear outputs. Overall accuracy including linearity, friction and hysteresis is ± 2% with resolution as low as 0.25%.

Utilizing the new design, the unit can withstand 55 to 500 cps at 10g's vibration with less than 1% error and 2000 cps at 25g's without permanent shift in calibration or damage.

The TPH-175 can withstand an acceleration force of 25g's in each of the three mutual perpendicular axes and shock up to 25g's without damage. Over-pressure up to 100% of the unit's range is possible with negligible calibration shift.

Circle No. 236 on Subscriber Service Card.

Miscues and accidental exposure to dangerous propellants and other chemicals can occur with shocking suddenness. Adequate water irrigation is an important key to minimizing such injuries and subsequent claims. HAWS Decontamination Bath is the answer . . . a complete safety station for immediate first aid.

HAWS MODEL 8600 DECONTAMINATION BOOTH

is made of durable, lightweight reinforced fiberglass plastic, and features Haws Eye-Face Wash Fountain, eight lateral body sprays and overhead spray unit. All are simultaneously activated by weight on the base-mounted foot treadle! Contaminated victims are instantly "covered" with water that floats away foreign matter from body and clothing.

At aeronautical and astronautical installations everywhere, HAWS Safety Facilities are important in boosting air-age safety programs. Find out what this equipment can mean to your operation. Full details sent on request, with no obligation.

contract awards

WASHINGTON—The Pentagon's Advanced Research Projects Agency awarded contracts totalling more than $400 million to private industry and other government agencies during Fiscal Year 1959.

Here is an official breakdown, giving a description of the work, the participating government agency, the principal contractor(s) with whom a contract has been placed or is being negotiated, and estimated project funding through FY '59.

Military Space Technology Satellite Systems

Project *Discoverer*, Sec/AF, Lockheed Aircraft Corp., $106,000,000; Project *Midas*, ARDC, Lockheed, $10,800,000; Project *Score*, ARDC & ASC, Convair, Div. of General Dynamics, $704,000; Project *Sentry*, Sec/AF, Lockheed, $96,600,000; Delayed repeater system (*Courier*), ASC (Primarily in-House), $3,000,000; Doppler navigation system (*Transit*), BuOrd., Johns Hopkins Lab., Lockheed, $1,383,000; Subsystems for meteorological project, ARDC, $1,151,000; Launch vehicles, ARDC, Douglas Aircraft, $18,300,000; Active repeater communications satellite (launch and control), ARDC, $1,000,000; Active repeater communication satellite (payload), ASC, $1,000,000.

Propulsion and Launch Facilities

Project *Saturn*, AOMC, in-house with engines from Rocketdyne Div. of North American Aviation, $24,508,000; Project *Centaur*, ARDC, Convair, Div. of General Dynamics, Pratt & Whitney, $16,000,000; Static Test Tower and Launch Stand construction (*Saturn*), AOMC, $9,492,000; Large thrust test stand, EAFB (1 million lb. thrust single chamber engine), ARDC, $240,000.

Tracking and Ground Environment

Project *Spacetrack*, ARDC (Primarily In-house), $1,299,000; JPL ground space surveillance, AOMC, JPL, $226,000; Spain and Japan tracking installations, ASC, $7,601,000; Instrumentation ship PVT. Joe E. Mann (PMTR), Philco Corp., $1,100,000; 2 VC-2 vessels (PMTR) BuAer., $2,300,000; Minitrack modifications and extensions, NRL (Primarily In-house), $11,740,000; Doppler system installation, BRL (Primarily In-house), $6,875,000.

Exploratory Research

Stagnation point ballistics, Army, R&D, Metallbau Semler, Munich, Germany, $290,000; Properties of materials at low temperatures, NBS, In-house, $184,000; Nine studies in space power research, ASC, $961,000; Study in space power research, BuShips, $200,000; Research in high temperatures and pressures, NOL, Bjorksten Research Labs, Inc., $115,000; Feasibility Studies (space propulsion and power sources), ONR, Princeton University, Curtiss-Wright, Republic Aviation Corp., University of California, $413,000; Feasibility studies (Project *Orion*, Adv. space propulsion and power sources), ARDC, General Atomic, Div. of General Dynamics, Aerojet-General, Reaction Motors of Thiokol, Plasmadyne Corp., Experiment, Inc., Aeronutronic Systems, Inc., Atlantic Research Corp., AVCO Research Lab., Rocketdyne Div. of North American Aviation, Fairchild Aircraft, Aero-Chem Research, Vidya Associates, RCA, $2,809,000; Feasibility studies (Heat rejection from space vehicles, advanced power sources), AOMC, Electro-Optical Systems, $182,000; Magnus effect study, BuAer, Flettner Aircraft Corp., $28,000; Plasma electron study, Army, R&D, Batelle Memorial Institute, Frankfurt, Germany, $307,000.

Ballistic Missile Defense (Project *Defender*)

Info. center on high altitude weapons effects, ARDC, Rand Corp., $144,000; Reentry physics studies, ARDC, Mass. Inst. of Tech., $4,646,000; Omni-Range Digital Radar, ARDC, Columbia University, $1,328,000; Electronically Steerable Array Radar, ARDC, Bendix Aviation Corp., $2,144,000; Missile Range measurements, ARDC (Primarily In-house), $3,435,000; ACANIA assignment to AMTR, ARDC, Stanford Research Institute, $575,000; H.F. ionospheric radar research, ONR (Primarily In-house), $535,000; Ballistic missile defense system studies, ARDC, Convair, Div. of Gen. Dynamics, $1,375,000; Atmospheric and ionization studies, ARDC, A.D. Little Co., Convair, Div. of Gen. Dynamics, $1,435,000; Radar discrimination, ARDC, Raytheon Corp., $680,000; Down range ship operation, AOMC, Radio Corp. of America, $2,700,000; High power radar research, AOMC, Cornell Aeronautical Lab., $1,361,000; Advanced radar research, ARDC, Mass. Inst. of Tech., Lincoln Lab., $515,000; Vertical probe launching, ARDC (In-house), $397,000; Decoy sorting radar, ARDC, Raytheon Corp., $1,180,000; Microwave radar, ARDC, RCA, $850,000; Artificial electron clouds study, ASC, Itek Corp., $39,000; Catalytic effects in discharges, BRL (In-house), $80,000; Design of hypersonic intercept system, ARDC, Convair, Div. of General Dynamics, $1,033,000; Hypervelocity impact research, BRL (In-house), $525,000; Hypervelocity impact research, BRL (In-house), $300,000; Photodetachment cross-section studies, NBS (In-house), $30,000; Digital phased array radar, AOMC, Sylvania Electric Products, Inc., $1,434,000; Transmission of ion and atomic beam studies, ASC, American Machine & Foundry, $100,000; Feasibility studies (Primarily GLIPAR) ONR, Gen. Atomic, Div. of General Dynamics, Stanford, Research Institute, Westinghouse Corp., Aeronutronic Systems, Inc., Allied Research Associates, University of Chicago, Convair, Div. of Gen. Dynamics, General Electric Tempo, General Mills, Inc., Houses Aircraft Co., Industrial Research Assoc., Ramo-Wooldridge, RCA, Republic Aviation Corp., Technical Operations, Inc., $1,780,000; Feasibility studies (satellite defense systems, missile phenomenology), ARDC, RCA, Convair, Div. of General Dynamics, General Electric, Lockheed, Gen. Atomic, Div. of Gen. Dynamics, Republic Aviation, Dikewood Corp., Allied Research Associates, $3,805,000; Feasibility studies (Space intercept, re-entry, and target studies), AOMC, Solar Aircraft Corp., Bendix Aviation Corp., AVCO Research Lab., Raytheon Corp., Convair, Div. of Gen. Dynamics, $3,257,000.

Solid Propellant Technology

Studies of light element compounds, NBS (In-house), $500,000; Solid propellant research, BuOrd., Minnesota Mining & Mfg. Co., American Cyanamid, Aeronutronics Systems, Applied Physics Lab., Magna Propulsion, Atlantic Research Corp., Olin Mathieson, New York University, Navy (In-house), Allegany Ballistics Lab. (In-house), NOTS, NOL (In-house), $5,201,000; Solid propellant research, ONR, Ohio State University, Princeton Univ., Aerojet-General Corp., Aerochemical Research Lab., Univ. of Calif., Polytechnic Inst. of Brooklyn, Penn State Univ., $700,000; Solid propellant research, ARDC, Dow Chemical, Gallery Chemical, Monsanto Chemical, Pennsalt, Borden, Penninsular Chemresearch, Ethyl Corp., Atlantic Research Corp., National Research Corp., Univ. of Texas, Stanford Research Institute, Aerojet-General Corp., Univ. of Calif., Materials Research Corp., Materials Laboratory, WADC (In-house), Air Force (In-house), $3,910,000; Solid propellant research, AOMC, Esso Research & Engineering, Allied Chemical, Olin Mathieson, Army (In-house), Rohm & Haas (In-house), $3,267,000; Solid propellant research, OOR, University of Chicago, Duke Univ., A.D. Little, Vanderbilt Univ., Univ. of Florida, $630,000; Solid propellant research, BuMines (In-house), $215,000.

Civilian Space Programs Transferred to NASA

2 lunar probes; cosmic ray experiment; 12 ft. sphere, AOMC, $18,820,000.

3 lunar probes, ARDC, $7,600,000.

Ground scanning for lunar probes, NOTS, $400,000.

Meteorological payload, ASC, RCA, $6,711,000.

Other announced awards included:

NAVY

The Sperry Gyroscope Co. has been selected as the prime contractor for the development and assembly of navigational equipment for the new version of the *Pol* missile-firing submarine. (Initial con ls for $2 million.)

Sylvania has received $10 million in tracts for the development of munications systems for the *Polaris* gram.

$1,195,386—West Bend Aluminum Co., Bend, Wis., for *Zuni* rocket launcher

AIR FORCE

$63,000,000—General Electric Co., Del Systems Dept., for radio-command g ance systems for the *Atlas*.

$15,326,000—Hercules Powder Co., Wilm ton, Del., for research and develop of a third-stage engine for the *Min man* ICBM.

$12,458,351—Douglas Aircraft Co., Inc., S Monica, for components, ground sup equipment, spare parts and technical engineering data on *MB-1* rocket.

$11,000,000—Westinghouse Electric Aircraft Equipment Dept., for elec power generating system for the AF bomber. (Prime contractor **Convair Di General Dynamics.**)

$7,000,000—Melpar, Inc., Falls Church, for production of F-101B weapon sy simulators. (Initial amount of this tract $2,500,000, the ultimate value cess of $7,000,000.)

$5,000,000—General Electric Co., Flight pulsion Div., Cincinnati, for turbojet craft engines, data and bill of mat for German, Lockheed designed F-10 craft.

$3,000,000—Hughes Aircraft, Culver Calif., for aircraft and weapons co systems, engineering services, mat and data.

$1,843,944—General Precision Labor Inc., Pleasantville, N.Y., for addi procurement of components for AN/APN-81 Doppler Navigation syst

$525,000—Lockheed Aircraft Corp., G Div., for research in connection with newly-developed titanium alloys.

$398,944—RCA, Harrison, N.J., for v electron tubes.

$179,069—Bomarc Laboratories, Beve Mass., for various electron tubes.

ARMY

$22,200,000—Martin-Orlando, for addi *Lacrosse* missiles and related g equipment.

$2,961,000—Martin-Orlando, for contin of engineering services for the *La* system.

$1,868,404—Paul Hardeman, Inc., Los les, for missile launch complex "H P.L.S. equipment for ODTF at Va berg AFB.

$1,038,000—Rocketdyne Div., North can Aviation, Inc., Canoga Park, fo sified contract.

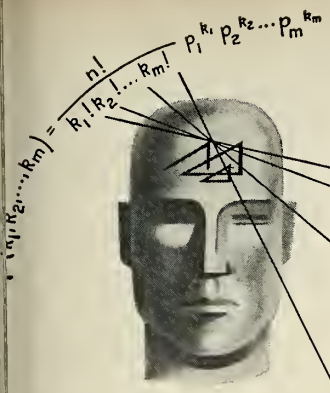
$977,941—Cubic Corporation, San Die an electronic measuring system for tracking research and developmen missiles and to assist in further de ment of missile systems at White

$755,000—Douglas Aircraft Co., Santa M for *Nike* adapters and research a velopment (two contracts).

$629,155—Autonetics Div., North Am Aviation, Inc., Downey, Calif., for computers.

$500,000—Olin Mathieson Chemical for exploring uses of an advanced propellant for the *Nike-Zeus* missi

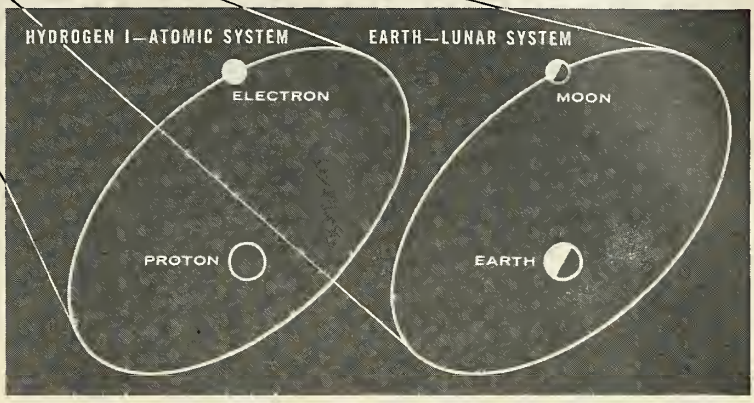
$402,765—Montgomery Ross Fisher, In Angeles, for silo launch test co Phase III, static test facility at E AFB.



$280,072—Parish Pressed Steel, Div. o Corp., Reading, Pa., for rocket wa

$260,483—Gilfillan Brothers, Inc., Los les, for engineering services.

$165,236—Carrier Corp., Cambridge C Lowell, Mass., for container for sto 28,000 gals. of liquid oxygen or nitrogen.



$151,365—Brown Engineering Co., Hun Ala., for additional continuation c with the Army Ballistic Missile

ENGINEERS—SCIENTISTS

Is order and organization in MACROCOSM and MICROCOSM an underlying principle of the universe... or does a fundamental state of randomness prevail in the cosmos, as might be expressed by the multinomial formula at left?

BOLD MINDS

THROUGHOUT HISTORY..... BOLD MINDS have sought to understand the forces at work in the universe, and as they developed working hypotheses, endeavored to turn all knowledge to their own purposes, devising philosophical and mechanical systems of their own.

As old hypotheses become inadequate or untenable, thinking men devise new ones. So the concept of a "flat" world has changed to an oblate orbiting spheroid—mere speck in a vast and expanding universe; so "empty" formless space is regarded as a curved continuum occupied by random knots of turbulence (creating the new branch of mechanics—hydromagnetics).

Today new horizons of discovery and surmise arise before the speculative mind.

ENGINEERS AND SCIENTISTS AT REPUBLIC FEEL KINSHIP WITH ALL BOLD MINDS OF PAST AND PRESENT, AS THEY FACE THE EXHILARATING CHALLENGES OF CREATING VEHICLES TO FLY IN ENVIRONMENTS WHERE NEW APPROACHES IN THERMO/AERODYNAMICS MUST BE MADE...AS WELL AS APPROPRIATE PROPULSION AND ELECTRONIC SYSTEMS TO POWER AND GUIDE TRANSIT IN SPACE

Groups of Research, Development and Experimental Engineers and Scientists at Republic Aviation are now working on projects over the whole range of aeronautics and astronautics—from supersonic and hypersonic weapons systems, both manned and unmanned, to plasma propulsion and space electronics.

Imaginative professional men at many levels of experience are invited to inquire about opportunities indicated below:

ELECTRONICS
- Inertial Guidance & Navigation
- Digital Computer Development
- Systems Engineering
- Information Theory
- Telemetry-SSB Technique
- Doppler Radar
- Countermeasures
- Radome & Antenna Design
- Microwave Circuitry & Components
- Receiver & Transmitter Design
- Airborne Navigational Systems
- Jamming & Anti-Jamming
- Miniaturization-Transistorization
- Ranging Systems
- Propagation Studies
- Ground Support Equipment

THERMO, AERODYNAMICS
- Theoretical Gasdynamics
- Hyper-Velocity Studies
- Astronautics Precision Trajectories
- Airplane/Missile Performance
- Air Load and Aeroelasticity
- Stability and Controls
- Flutter & Vibration
- Vehicle Dynamics & System Designs
- High Altitude Atmosphere Physics
- Re-entry Heat Transfer
- Hydromagnetics
- Ground Support Equipment

PLASMA PROPULSION
- Plasma Physics
- Gaseous Electronics
- Hypersonics and Shock Phenomena
- Hydromagnetics
- Physical Chemistry
- Combustion and Detonation
- Instrumentation
- High Power Pulse Electronics

NUCLEAR PROPULSION & RADIATION PHENOMENA
- Nuclear Weapons Effects
- Radiation Environment in Space
- Nuclear Power & Propulsion Applications
- Nuclear Radiation Laboratories

A new $14,000,000 Research Center—to be completed this year—is part of Republic's far-ranging R&D programs aimed at major state-of-the-art breakthroughs in every flight regime & environment.

when and where

JUNE

United Nations Educational Scientific and Cultural Organization, UNESCO House, Paris, June 15-20.

Michigan Aeronautics and Space Association, Industrial Missile and Space Conference, Sheraton-Cadillac Hotel, Detroit, June 16-17.

Cornell University Industry Engineering Seminars, Ithaca, N.Y., June 16-19.

Institute of the Aeronautical Sciences, National Summer Meeting, Ambassador Hotel, Los Angeles, June 16-19.

Institute for Practical Research on Operations, The University of Connecticut, Storrs, June 21-July 3.

American Institute of Electrical Engineers, Air Transportation Conference, Olympic Hotel, Seattle, June 24-26.

Nuclear Industry Division, Instrument Society of America, Second National Symposium, Idaho Falls, Idaho, June 24-26.

Institute of Radio Engineers' Professional Group on Military Electronics, Third National Convention on Military Electronics, Sheraton-Park Hotel, Washington, D.C., June 29-July 1.

Pennsylvania State University, Summer Seminar on Plastics—Its Mechanical Properties, Design and Applications, University Park, Pa., June 29-July 3.

JULY

Tenth Annual Basic Statistical Quality Institute, University of Connecticut, Storrs, July 12-24.

Radio Technical Commission for Aeronautics and Los Angeles Section of the Institute of Radio Engineers, Third Biennial Joint Meeting, Ambassador Hotel, Los Angeles, July 16-17.

Second Annual Institute on Missile Technology, Chief of Research and Development, U.S. Army, University of Connecticut, Storrs, July 26-Aug. 7.

The Denver Research Institute of the University of Denver, 6th Annual Symposium on Computers and Data Processing, Stanley Hotel, Estes Park, Colo., July 30-31.

AUGUST

Institution of Investigation of Biological Sciences, sponsored by Air Force Office of Scientific Research-Aeromedical Div., World Health Organization and United Nations Educational, Scientific and Cultural Organization, Montevideo, Uruguay, Aug. 2-7.

William Frederick Durand Centen Conference, Problems of Hypersc and Space Flight, Stanford Univers Stanford, Calif., Aug. 5-7.

Institute of Radio Engineers' Professic Group on Ultrasonics Engineering, F National Ultrasonics Symposium, S ford University, Stanford, Calif., A 17.

Institute of Radio Engineers, West Electronic Show & Convention, C Palace, San Francisco, Aug. 18-21.

American Rocket Society, Gas Dynar Symposium, Northwestern Univer Evanston, Ill., Aug. 24-26.

International Astronautical Federat 10th Annual Congress, Church Ho Westminster, London, Aug. 31-Sept

SEPTEMBER

Air Force Office of Scientific Research General Electric Company's Missile Space Vehicle Department, Confere on Physical Chemistry in Aerodynar and Space Flight, University of P sylvania, Philadelphia, Sept. 1-2.

Air Force Association and Panora send reservations to AFA Hou Bureau, P.O. Box 1511, Miami Be Sept. 3-6.

Standards Engineering Society, Bo Section, Eighth Annual Meeting, H Somerset, Boston, Sept. 21-22.

se the attached prepaid reply cards. Circle numbers shown on ply card that correspond with numbers appearing beneath items ed. If no circle number accompanies the article or advertise- give page number (and advertiser's name) on line provided at of the card.

our requests for information will be forwarded promptly to the nies concerned.

NEW PRODUCT BRIEFS

RELAY. A small rugged SPDT eloped for use in printed cir- ere relay is self-supporting. on has been modified to allow duction of a low-priced, re- y for use in radio sonde, mo- unications and commercial ap- r. Standard operating voltage 24 VDC, DC resistance range ms, DC power requirement— t Standard contact rating is up ere 50 VDC, resistive.

240 on Subscriber Service Card.

FR HOSE. Fluoroflex-T(eflon) se, said to be chemically in- a jet and missile fuels and oxi- h been developed by Resisto- r. The abrasion-resistant rubber is inforced with a spiraled high- w to prevent crush or collapse. e of Fluoroflex-T is carried e hose and over the face of n fluids being transferred can- m in contact with or be con- d y the metal flanged fittings or o ring. The non-adhesive surface te on permits rapid flow of fluids tt or no buildup of corrosive l nonaging characteristic in- on service life. Current produc- f luoroflex-T chemical transfer r round handling equipment use 1½", 2" and 3" diameters to e engths. Larger diameters will il e shortly.

No. 241 on Subscriber Service Card.

NT METER. A 25-turn potenti- r, urnished in a length only y l ger than most 10-turn units, ce y been introduced by Litton rie Potentiometer Division. Desig- th MD20-25, the unit meets or ls l military specifications for ior ters, with .0075% linearity 005 resolution a Litton produc- an rd for this 2-inch model.

No. 242 on Subscriber Service Card.

DE ASSEMBLY. Resolving shaft ons o l part in 10,000 can be wit the CG-701 Geared Encoder bly now available from Datex rat n. Designed for use where um ze and weight are important, sen y uses two Datex shaft posi- nco ers and a gear box. The en- use on the input shaft provides pos ons of the least significant per 60° rotation. Because the disc s e oder is coupled directly to put haft, accuracy is that of the er ed. This input unit is then geared 10:1 to a 10-position encoder. The low-speed encoder utilized double-brush, lead-lag logic to eliminate ambiguities due to gear inaccuracy and backlash. Hence, the accuracy of the CG-701 is determined only by the accuracy of the encoder attached to the input shaft. The CG-701 is 3" in diameter, 3" long (exclusive of shaft), and weighs 19 ounces.

Circle No. 243 on Subscriber Service Card.

PRESSURE SWITCH. Now available for use in all types of systems is a ¼ oz. transistor-size pressure switch designed for surge, leak, and variance detection which has been produced by Century Electronics and Instruments Co. Now in use as automatic leak detectors on missile programs, the unit has the following capabilities: setting limits, 1 to 100 psig; proof pressure, 3000 psig; operating range, 1 to 500 psig; burst pressure, 5000 psig; temperature, −65°F to +250°F; vibration, 0 to 2000 cps at 10g.

Circle No. 244 on Subscriber Service Card.

NEW ALLOYS. A new magnesium-rare earth metal alloy for missile applications has been developed by The Dow Chemical Company. Sand castings in the new alloy, designated EK31XA, are being produced by Dow for evaluation by prospective users. EK31XA sand castings combine room-temperature tensile properties with tensile strength at elevated temperatures up to about 600°F and also exhibit creep resistance at these elevated temperatures for times up to 10 hours, according to Dow. In long-term properties, including creep strength up to 1000 hours, EK31XA sand castings are serviceable to about 450°F, Dow said. Composition of the alloy is 3.2% rare-earth metal, 0.6% zirconium, balance magnesium.

Circle No. 245 on Subscriber Service Card.

CERAMIC COATING. An organic-ceramic coating developed by Dyna-Therm Chemical Corp. is reportedly capable of resisting extreme temperatures and adhering to almost any type of metal surface. Termed L-154, the material features gas-erosion characteristics of ceramics while requiring only standard industrial spray equipment for application. No enameling or curing ovens are needed. L-154 offers high dielectric strength, according to the manufacturer, as well as thermal shock resistance as low as −100°F.

MISSILE LITERATURE

HYDRAULIC TEST CART. A 2-page, technical bulletin, No. 1373, describing a portable, self-contained hydraulic test cart for missile field test procedures is now available from the George L. Nankervis Company. Illustrated with photographs, dimensioned line drawings and a circuit schematic, this bulletin discusses various operational characteristics and specifications of the Nankervis Model 9462 test carts for field use. These carts supply 10-gpm of clean, tempered oil at up to 3000 psi. They are mounted on four-wheel axles with automotive type steering and are easily moved by one person. Oil is filtered to 2-5 microns and system components are of stainless steel to minimize contamination.

Circle No. 200 on Subscriber Service Card.

SWITCHES. A four-page catalog describing eight high-temperature thermal and seven waterproof switches, is available from Control Products Inc. Photographs, dimension drawings, specifications and characteristics are included of these plug, probe, and surface types of thermal controls for governmental and industrial applications and waterproof switches for use in applications requiring conformance to government standards or military specifications.

Circle No. 201 on Subscriber Service Card.

SEQUENCE INDICATIONS. The Opad Electric Company has released a two-page catalog sheet describing their new line of panel mounting Phase Sequence Indicators. Designed for integretion in test stands and panel boards, these instruments permit rapid determination of the order in which the voltage peaks of a three-phase power supply occur. Bulletin 1551 covers seven standard models and includes dimensioned outline drawings of the instruments.

Circle No. 202 on Subscriber Service Card.

ELECTRICAL CONNECTORS. A fully-illustrated catalog describing the complete line of Joy electrical connectors for industry has been issued by the Electrical Products Division of the Joy Manufacturing Company. In addition to orienting the reader by means of an illustrated nomenclature of terms and references used in the description of electrical connectors, the literature also lists electrical current ratings for cable, as based on wire gauges and number of wires.

Circle No. 203 on Subscriber Service Card.

TEST CHAMBER. A new 12-page catalog covering their line of environmental test chambers has been published by the American Research Corp.

Circle No. 204 on Subscriber Service Card.

FIELD EMISSION CATHODES. A paper giving results of research conducted by the Linfield Research Institute for the U.S. Air Force on field emission cathodes is available from the Office of Technical Services of the U.S. Department of Commerce. The program was undertaken in two phases, one of which led to improvement of stability of the field emission cathode and the other involving study of the electrochemical behavior of refractory metals used to meke field emitters.

REVOLUTION IN DESIGN

Grove Regulators... As revolutionary in design and engineering as the technological transition from flying machine to space vehicle... Achieved a quarter of a century ago, the only regulators which could be used for the first missile experiments in the Navy Experimental Station at Annapolis ... still today the standard for the critical control of high pressure fluids... Now on the threshold of space, Grove is uniquely prepared—through advance research and development—to meet the challenge of even higher pressures ahead.

New, Electro Instruments all-electronic, totally transistorized digital voltmeter

50 conversions per second • 1000 megohms input impedance • Fully automatic ranging

Model 8409 Voltmeter and Ratiometer

all the features you want in a medium-speed digital voltmeter

- 3 ranges, 9.999/99.99/999.9 volts
- Automatic, manual and remote ranging
- Automatic polarity
- One digit accuracy
- 4 digit in-line visual readout
- BCD and decimal electrical output
- Direct printer operation—local/remote control
- New 5¼" x 19" front panel
- Modular construction throughout
- Provision for external reference voltage

Plus accessory modules for every application

AC: All transistorized Model 110; considerably faster AC/DC conversion than presently available models. Fully automatic ranging and direct AC voltage readout on the Model 8409.

Ohmmeter: All transistorized Model KIM-000. Provides constant current through test resistor with negligible power dissipation. Voltage measurements made across resistor and read out directly in ohms with fully automatic ranging.

Also scanners, code converter modules, print control modules and many others to solve all digital problems—from simple voltmeter applications to complex data logging systems.

Ask your  *representative for complete information.*

torture-tested to perfection for big relay performance

These sensitive Leach subminiature relays deliver big relay performance . . . in a crystal can size that makes them ideal for use in missile control circuits in airborne or ground equipment and in computer and printed circuits.

Torture-tested to perfection in the Leach Production Reliability Center, these subminiatures are designed to meet the critical extremes of vibration, shock and other stringent environmental requirements in military and commercial applications.

They meet the specifications of both MIL-R-25018 and MIL-R-5757C—as well as MIL-R-6106C, *including the minimum current test requirements.*

Uniform contact pressure and overtravel are guaranteed for the life of these balanced-armature relays. They are available in a wide range of socket, stud and bracket mountings to meet specific customer requirements.

Write today for Leach Crystal Can Relay Brochure containing specifications, typical ratings and other information on these subminiatures! Or contact your nearest Leach sales representative to discuss your specific subminiature relay requirements.

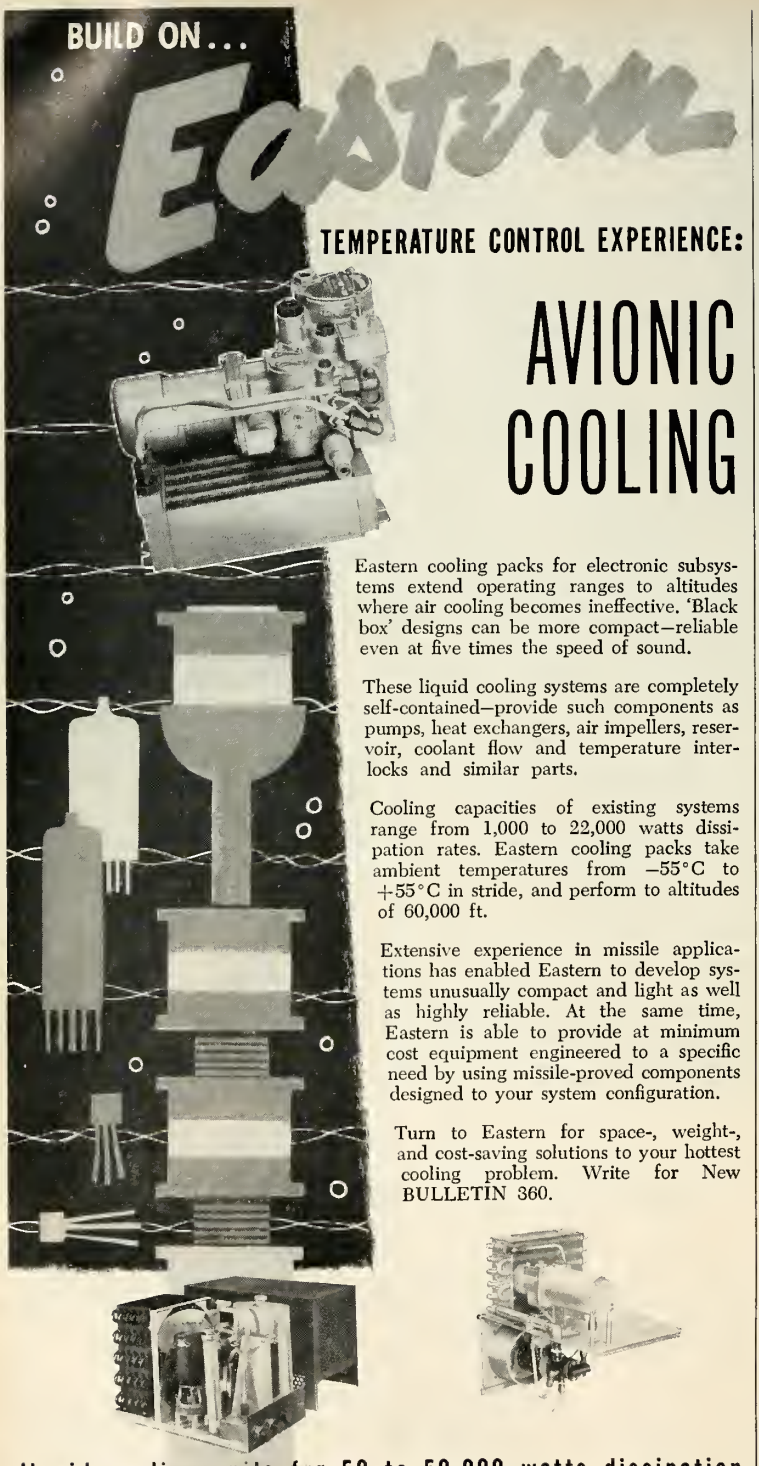
The Mission is Simulated—the Experience is Real!

l the complex, split-second action of modern all-
ather and night missions, the experience and trained
lexes of a pilot spell success or failure. And today,
e only practical, economical way to build such experi-
ce is with electronic flight and weapons system simu-
lors that create and re-create every situation of an
tual mission itself.

At Curtiss-Wright, the art of simulation has reached
beyond representing the aircraft alone. Curtiss-
right builds equipment for simulation of all-weather
erations, complete tactical missions, and entire
apons systems, for the most advanced fighters, bomb-
and heavy bombers, as evidenced by simulators built
the U.S. Navy's F4H1 and A4D, and the B58 for
U.S. Air Force.



Tactical simulators include such sophisticated functions as simulation of radar fire control systems, search and bombing radar systems, electronic countermeasures simulation, and action of the airborne armament missiles themselves.

With these skills and capabilities, Curtiss-Wright is prepared to design and produce complete training equipment for a single aircraft or entire weapons systems — providing the priceless experience that only this modern training equipment makes possible.

Wake Up and Live

These are troubled days for the aerospace industry, once known as the aircraft industry. Individually and collectively its member companies are taking a beating on Capitol Hill, in the Pentagon and in their once-excellent public relations to the point where they are now being alluded to by the President as a munitions lobby.

And it is largely their own fault.

They have only recently witnessed the embarrassing sight of one of the most powerful men in Congress, Chairman Carl Vinson of the House Armed Services Committee, mercilessly chastising the industry in a relentless attack on their renegotiation position.

The military leaders, once staunch allies, have not rallied to the industry's support. The daily press has played the news straight from government releases and the result has not been kind.

The truth is that the aerospace/aircraft industry is no longer the protected darling of the gods in Washington and it is time that its members faced up to this fact.

The days when an aircraft company president—if he didn't like the way things were going for his company—called up the chief of staff and set matters right, are gone forever. So are the days when the aerospace/aircraft industry didn't have to fight its battle on the Hill because the military fought it for them.

The aerospace industry is the biggest manufacturing industry in the world (753,500 employees against 741,900 for automobile at last count) and its members must learn that it's a tough world with very tough competition for the breaks. Most other major segments of U.S. industry faced up to it a long time ago.

The aerospace industry will probably not always remain largest as an employer, because the articles it makes tend to become more expensive in cost and fewer in numbers. (What effect this will have on the national economy is worth thinking about.) But most certainly in the foreseeable future it will rank among the most important, both in dollars and national security.

From a position not quite so close to the forest, we would like to suggest to the industry that it consider certain actions:

Take active steps to avoid being classified as a chosen, favored, captive or kept industry. The once-accepted fact that the country had to maintain a base for mobilization is a lot less true in these days of instantaneous warfare. Companies stay alive these days only on their competitive skill, diversification, ingenuity and courage.

Agree on a legislative program and unite behind it. Congressional battles can be won on the home front a lot easier than in Washington. Renegotiation appears to be a lost cause for the moment. Indemnification for unusual risks is bottled up in Congress and probably won't emerge at this session. Revision of the NASA patent inequities will come only when Congress is convinced they are really inequitable. Look to Washington for guidance and cohesion, but don't leave it all up to the people there.

Forget the fact that relationships with the Pentagon were once a matter of personal friendships forged in the canvas-winged biplanes of World War I combat or in the barnstorming days of the Twenties. There's a new crop of men making the decisions these days in the Pentagon and at Wright Field, Huntsville, BuAer and BMD. And a new crop flying your planes and guiding your missiles. Most of them don't know the company presidents and don't expect to. But these are the men who have to know your product and believe in it, because they are the ones who, in the long run, really dictate the purchase and use of it.

As for Congress, getting industry's story over to them is a matter of proper communication. And in this field, whether it involves Congress, the military or the public, perhaps the most important requirement visibly lacking is a strong central policy or philosophy. What is the industry's philosophy on the team concept, especially, if two or more major primes must join on a contract to achieve the best possible product? What is the industry's position on government versus private ownership of facilities? What has the aerospace industry done about explaining the financial and economic facts of life to its biggest customer—the military, especially the younger generation of military officers? Has a real effort been made to inform Congress of industry's position on the negotiated versus the advertised contract and the reasons therefore? Or that negotiated contracts are really based on competitive bids, with the losers forfeiting time, work and tremendous sums by competing?

Right now, many of the decisions themselves are no more important, it seems to us, than the fact that the industry must unite on them. And match its philosophy with the needs of a changing world.

Clarke Newlon

HOW SAC's "HOUND DOG" SCENTS ITS TARGET

The crew of the B-52G starts up the jet engine of the sharp-nosed GAM-77 Hou Dog missile hung under its wing... gives its inertial autonavigator the location of the targ

On a "for-real" mission, the Hound Dog would leap toward its target at supersonic spe —very likely a ground-defense center hundreds of miles away. Its guidance system can't jammed... can't be decoyed.

Purpose of the GAM-77 air-to-ground jet-powered guided missile is to increase the striki power of Boeing's B-52. Sling a pair of Hound Dogs under the wings of the new B-52G—a you have what amounts to a brand-new weapon system.

The GAM-77 program was started in August, 1957. The missile has been put into accelerat development. It already is in its early flight test phase... will be deployed by 1960.

Weapon system contractor: the Missile Division of North American Aviation.

MISSILE DIVISION NORTH AMERICAN AVIATION, INC., DOWNEY, CALIFORNIA

washington countdown

The Navy has decided to go along with development of a medium range ALBM—probably with a *Polaris* second-stage configuration.

Leading frame manufacturers are being asked or will be asked to submit proposals. Already under consideration are **Martin's** *Bold Orion* (M/R Dec. 1, 1958) and **Lockheed-Convair** and **McDonnell** proposals submitted to AF during ALBM competition won by **Douglas.**

Insiders are speculating on whether the Office of Secretary of Defense will allow two almost parallel programs.

The **Douglas** ALBM will have a range of from 1000 to 1500 miles. The 750-mile range Navy ALBM would be launched from carrier-based-jets—possibly the Mach 2 Vigilante A3J under development by North American.

IN THE PENTAGON

The long-range significance . . .

of the compromise "master plan" for U.S. air defense is that the advocates of the offense have won a victory. They have contended that the Soviet bomber threat is on the decline and the ICBM threat is rapidly mounting. Therefore, they argue that every available dollar must be spent on the one defense-in-being against the ICBM—the offensive power of SAC.

• • •

Both the Western Electric . . .

Nike-Hercules and the **Boeing** *Bomarc* suffered with greater acceptance of offense advocates' viewpoint. But *Nike-Hercules* suffered less because it is already here. *Bomarc-B* is about two years away. Therefore, it took the bigger slashing.

• • •

The Pentagon sought . . .

to sweeten the "master plan" with the extra $137 million for *Nike-Zeus.* And more sweetener may be on the way in the form of Pentagon agreement to spend extra millions on ICBM's—specifically the **Convair** *Atlas* and the **Boeing** *Minuteman.* But the mood of Congress is still sour. The end of the battle is nowhere in sight.

• • •

The next shot . . .

in ARPA's *Discoverer* series is expected this week—the second shot this month. The *Discoverer IV* will not carry animals in its biomedical capsule. But an attempt is expected to be made to recover the capsule from orbit.

• • •

Australian observers believe . . .

the Woomera range may soon become second only to Cape Canaveral in the firing of satellites and rockets. Already, British, American and Australian scientists are gathering in Salisbury, near Adelaide, South Australia, for more *Black Knight* tests and what may be Britain's first satellite launching attempt within several months.

ON CAPITOL HILL

The big congressional furor . . .

over the so-called "munitions lobby" is expected to grow warmer with the summer. But whether it will stay warm enough to be served up during the 1960 presidential campaign will depend on the forthcoming House investigation into the hiring of retired military officers by defense contractors.

• • •

Meantime, here are a couple of . . .

related developments to watch for on capitol hill:

. . . Rep. Leonard Wolf (D-Iowa) is considering introduction of a bill that would ban private industrial patents on inventions developed with Federal defense funds.

. . . The Hébert Subcommittee probably will complete hearings on its weapon system concept investigation before beginning the new investigation about July 6. But don't look for a report until after the retired military men are heard.

AT NASA

An attempt to launch . . .

Vanguard III is scheduled for sometime this week. The 20-pound satellite will carry instruments to measure the effects of lightning and the radiation-heat balance between the earth and the sun.

AROUND TOWN

Some of the reports . . .

that are being passed as the "latest" in the nation's capital:

. . . Rep. Victor Anfuso's House Space Subcommittee which was set up to look into space developments in foreign parts won't be doing any travelling for a long time.

. . . The Russians may have tried but failed to launch a space vehicle to Venus during the optimum period early this month.

. . . The White House is reverting to its old pre-Sputnik attitude toward science.

industry countdown

STRUCTURES

Construction is about . . .
to begin on second hardened *Titan* base at Lowry AFB, Denver. Low bidder to build the nine-silo complex within 770 days was **Morrison-Knudson & Associates** at $26.9 million. M-K is building the first base. The two contracts total $69 million.

• • •

There are reports . . .
second stage of the **Lockheed** *Polaris* is being seriously studied by Navy as an air launched ballistic missile. System would have aircraft carrier capability.

• • •

Navy has publicly confirmed . . .
that it is developing the nearly 20-foot long *Astor* torpedo. It forgot to mention that the **Westinghouse** development has more than twice the 10,000-yard range of the Mk. 39 and that it's a real achievement in wire-guided torpedos because some of the wire's negative buoyancy characteristics have been eliminated. The 20-knot *Astor* has more range than sonar capabilities of detecting submarines. Density layers still can't be penetrated to detect subs beyond 4000 yard range even though Navy is experimenting in low frequency and one report has it that 30-foot transducers (which slows one target ship considerably) still won't transmit an appropriate signal.

• • •

In-house study . . .
of launcher and other MSE to fire *Minuteman* from mobile railroad car (M/R June 1, p. 18) is underway by **American Machine & Foundry.** AMF called in **American Car & Foundry** to develop design of the missile train cars, which may be camouflaged as standard-appearing freight trains.

• • •

DOD will be responsible . . .
for NASA industrial security. Idea behind agreement worked out by the two agencies is to eliminate duplication and unnecessary confusion in contractor plants.

PROPULSION

Replacement of metal nozzles . . .
on solid-fueled rocket motors with plastic is being actively considered by **Aerojet-General.** Possible switch comes from A-G's own research in plastics and partially from "breakthrough" on *Nike-Zeus* plastic rocket nozzle disclosed recently.

• • •

New design for missile . . .
auxiliary power units by **Garrett Corp.'s Air-Research Division** uses single block to house all operating valves and reduces valve number from 18 to seven. Turbine APU operates on either ethylene oxide, hydrozine or, with modification, a solid propellant. The 85-pound unit can deliver 5 hp for 7½ minutes.

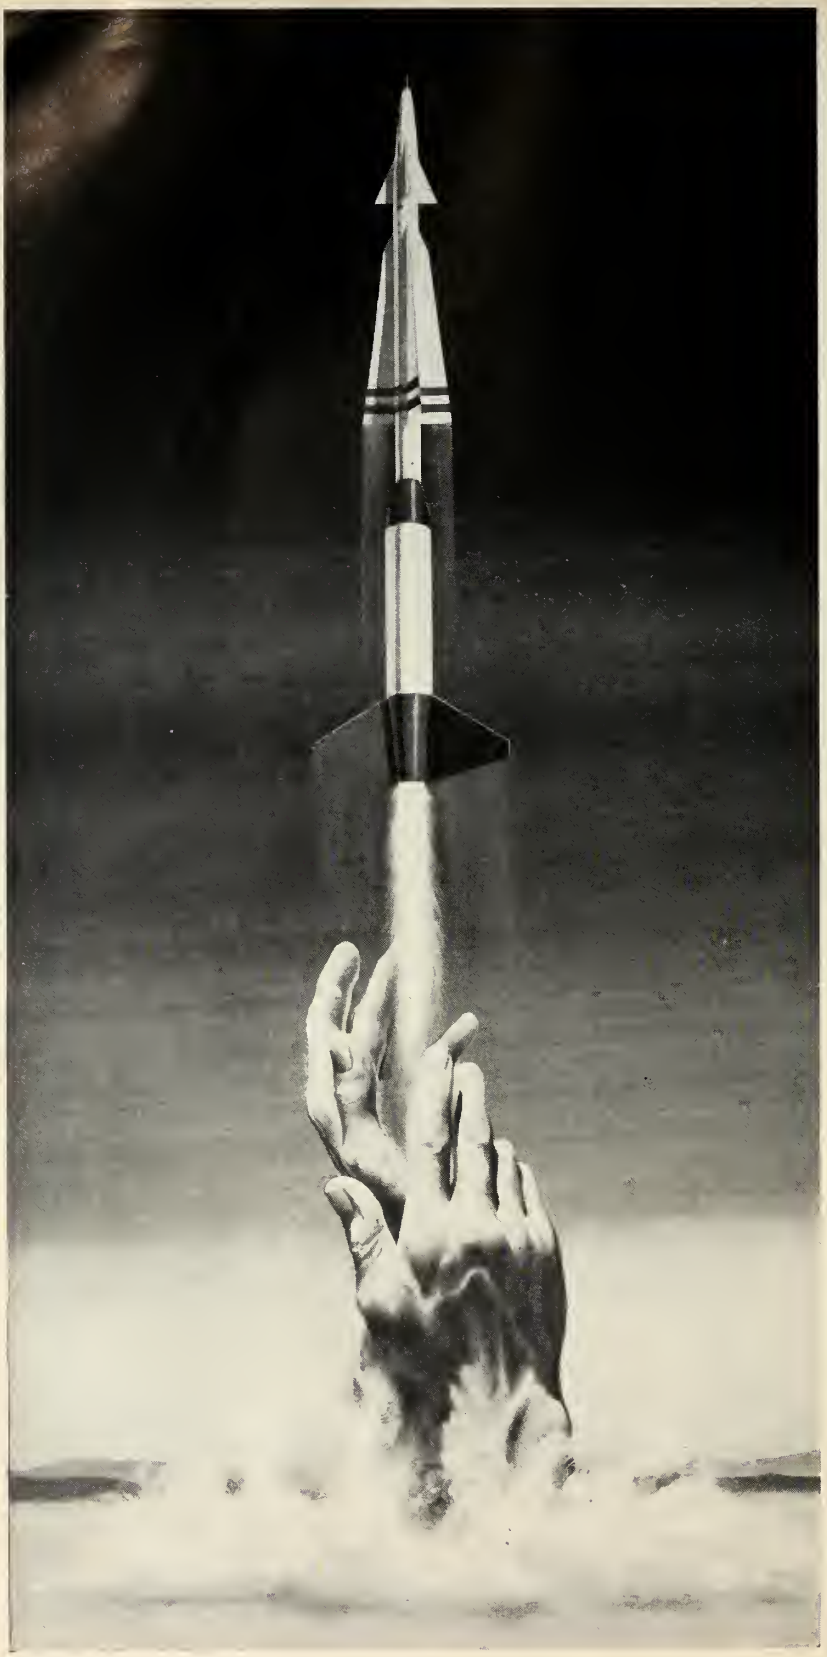
ELECTRONICS

A 100 million-mile . . .
digital communication system reportedly has been developed for use in deep space probes. **Space Electronics Corp.'s** "Digilock" more flexible and sophisticated—though smaller—than others presently in use, reportedly can vary sample rate from 100 to 25,000 sps and trade off between transmitter power and amount and accuracy of data. With addition of demodulation circuitry, existing telemetry receiving equipment can be used with the system. Built for JPL, system should provide communication efficiency close to maximum possible under information theory.

• • •

For *Atlas* guidance . . .
General Electric has come up with "Hi-Fi" precision radar tracking antenna capable of measuring an angle of one foot at 25 miles. Tolerances in mechanical components of antenna and its pedestal and driving mechanisms are comparable to those in a fine watch and unprecedented in manufacture of large units.

• • •



ARPA $600,000 contract . . .
for comprehensive study of feasibility of tracking and intercepting enemy space satellite is in hands of **RCA.** Scheduled for completion in six months, study will provide information on requirements for further R&D to design system for operational capability in 1965-70 time period.

ASTROPHYSICS

Study contract for $50,000 . . .
has been awarded **Republic Aviation** by ARDC to find efficient means of keeping track of man-made satellites. Study will analyze trajectory of dog-carrying *Sputnik II,* which was launched Nov. 3, 1957, and came down April 14, 1958.

• • •

"Space trainer" is proposed . . .
by **Convair,** using *Centaur* rocket to orbit a four-room satellite. Two-man glide rockets would ferry crewmen to the trainer for conditioning and orientation to prepare for long space trips.

rockets and missiles

Componentry capabilities of the Kelsey-Hayes Company as a supplier of precision propulsion assemblies, structu parts and exotic high temperature materials for first and second generation rockets and missiles include—

Swivel nozzles, hydraulic control system and auxiliary power supply systems for thrust vector control; weldments, rocket and combustion chambers for liquid and solid propellant propulsion systems; inner cones, exhaust cones, rotating wh assemblies; vacuum induction melted alloys to withstand corrosive and extremely high temperature atmosphere advanced design, research and develop- ment in gas dynamics, internal ballistics transient heat and thermal stress analy

How Big A Missile Support File?

AF list will start with some 2500 data sheets but opinions differ on how much longer it will get

by William E. Howard

WASHINGTON—Air Force supply nnels are bulging with roughly 1.5 ion pieces of equipment—from ominiature transistors to multi-mil- dollar LOX generators. Each day to 500 more items are being added upport new missile/aircraft, com- ications and warning systems. (In 2 there were 725,000 items in the ly system.)

This enormous quantity, reflecting inually changing strategic require- ts and advancement in state-of-the- ile-art, is creating a king-size prob- for AF compilers of the "Technical Information File"—a first attempt to catalogue the fast-expanding missile/aircraft support equipment field.

Last in a Series on Missile Support

The first installment of this unusual reference guide being published July 1 will contain nearly 500 data sheets describing equipment in inventory. Later sheets will include equipment under development. But the question that is confronting TIF editors already is: How big should TIF be when complete?

A prime goal of the catalogue is to stem the birth rate of unnecessary equipment. For new weapons coming along, the AF wants gear listed in TIF to be utilized whenever possible by contractors, either as it stands or with modifications, rather than continue on with wasteful duplication that has already bloated AF inventories (M/R June 15, page 21.)

Can TIF become a really useful instrument in bringing about some order and standardization in the missile support field without listing the hundreds of thousands of handling, test and checkout items that already exist?

TIF Data Sheet

MIL-D-19731A

(ITEM NAME)
(TYPE OR MODEL DESIGNATION)
(Date of this Data Sheet) (Approved Nomenclature, if Available)
(Functional Classification)

Cognizant Service

FEDERAL STOCK NUMBER

	USA	USN	USAF	USMC
TATUS OR TYPE CLASSIFICATION				

anufacturer(s): Name or Code Number

ILLUSTRATION

(Include Approximate Over-All Dimensions and Weight)

UNCTIONAL DESCRIPTION:

Give a brief functional description of the item.

This information shall be presented in paragraph form and shall escribe specifically what the equipment does, what it is used for, hat it is used with, application, and where it is used.

The description shall support the functional class assigned nd include general operating and design characteristics.

R PRODUCTION of a typical TIF data sheet, to be inserted n oose-leaf volume. Pages will number 2500—for a beginning.

(ITEM NAME)
(TYPE OR MODEL DESIGNATION)

MIL-D-19731A

RELATION TO SIMILAR EQUIPMENT:

Describe differences and/or similarities to other equipment of the same general type and function.

This information shall be presented in paragraph form and include the nomenclature and type or model designation of the equipment discussed.

TECHNICAL DESCRIPTION

The following information, as applicable, shall be listed in tabular form:

Frequency range.
Power output and/or input (to include amperage, KVA, number of wires, phase, type of receptacle or plug, length of cable, etc).
Output signal characteristcs, range as rated, accuracies, sensitivities.
Pertinent electrical and mechanical characteristics and individual units of major importance (such as calibration, size, accuracy, type, etc of test indicators).
Dimensions (if for fixed installation, give necessary data for installing; for example, 1 in. lag bolt at each corner for concrete imbedment, etc).
Wheel size(s) and type(s).
Towing capabilities or restrictions.
Lifting capacity, rated and ultimate.
Lunette details.
Weight (dry and ready for operation).
Tie-down provisions.
Hydraulic and/or pneumatic characteristics (to include input/output pressure, flow, fluid/gas type and characteristics, receptacle or connector type, hose length, etc)
Other equivalent information applicable to special or unusual equipment.
If self-propelled automotive type equipment, include dimensions, tread, wheel base, turning radii, angles of approach and departure, minimum ground clearance, data relative to fuel system, clutch, transmission, transfer case, axles, frame, suspension, steering, brakes, electrical system, performance, cab, winch, etc.
List, in tabular form, the types and quantity of each type of electron tube, crystal and/or transistor used in the equipment.

REFERENCE DATA AND LITERATURE:

To the extent known, list the following information in tabular form:

Service and/or commercial instructional publications (give title and publication numbers).

Engineering test report (report number and date).

Specification: (number) - Drawing: (number) - Etc.

REVERSE of the same page, giving more detail space. An EIA spokesman says some sales sheets might be made identically.

No restraint on trade likely . . .

Both AF and industry officials who collaborated on the creation of the file firmly believe it is an important step forward, although viewpoints may differ as to what and how many items TIF should include.

Air Materiel Command officials assembling TIF at Wright-Patterson AFB believe that to achieve its goal of standardizing equipment in use, the contents must be highly selective, and restrictive. Accordingly, they are proceeding—with the approval of industry steering groups—to limit TIF initially, at least, to 2500 data sheets.

On the other hand, some industry experts believe that eventually the book will have to get much bigger—perhaps listing 100,000 or more items.

"We feel that the catalogue will lose its value to the contractor if it is too big," says one high official in AMC's Office of Cataloguing and Standardization. This officer explains that TIF is being put together as a "designer's guide." Its objective is to let contractors know what is in AF inventories, and flag them on what the AF wants designed into new weapons.

• **Sales effect?**—AF officials hasten to make clear that TIF is in no way likely to act as a restraint on trade.

Information given on TIF data sheets relates only to performance specs of the desired equipment. Also listed are makers of an item who have previously sold to the AF.

However, OCS authorities say that TIF will not be utilized as a procurement directory. Buying of spares and re-procurement of items will be done in the customary fashion.

In some respects, perhaps, TIF will amount to a sales brochure for the companies whose products are contained in it because their names will be continually before contractors, who are buyers. Unique specifications of one piece of equipment listed in TIF also might be designed into a weapon system, giving one supplier an advantage over competitors.

In its initial listings, OCS is limiting TIF to items of equipment which were designed specially to military specs and which cost $2000 or more per unit. As the number of data sheets approaches the 2500 total, AF and industry representatives from AIA, EIA, SAE and NSIA will make an evaluation as to proceeding further.

The $2000 minimum criterion is expected to be relaxed to permit the inclusion of items—particularly electronic—which have a unit cost lower than that figure, but which are purchased in large quantities.

TIF listings fall now strictly into the first of four AF procurement categories or classifications. These are: 1) military-designed equipment now in use or under development; 2) commercial-designed (off-the-shelf) items in the military supply system; 3) commercial items suitable, but not yet being procured; and 4) equipment which must be designed new.

Class two items may be included later.

• **EIA viewpoint**—In the opinion of Henry E. Bernstein, military engineering coordinator of EIA, TIF will have to be comprehensive—reaching around 100,000 entries. Otherwise, he says, contractors will not have enough information at their fingertips to keep them from redesigning an already existing piece of hardware.

"The cost of cataloguing is small compared to the cost of redundant redesign," observes the retired Navy captain.

On this point, however, AMC officials say they don't want TIF to become a catch-all with the AF footing the bill for what they believe would amount to a lot of free advertising.

Bernstein suggests that as an alternative manufacturers of items in the third procurement category—those without status—make up their sales sheets in a format identical to TIF data sheets (see illustration).

TIF is to be loose-leafed. Pages will be removable and inserts can be made to keep the file up to date.

Manufacturers who follow Bernstein's suggestion would send their equipment sales sheets directly to contractors—leaving it up to the contractors to evaluate the product and decide whether they should insert it in TIF for consideration by their designers.

Bernstein points out, for instance, that one firm may make a cathode ray oscilloscope designed in-house that is several grades better than anything listed in current AF performance specs. The present system for inclusion in TIF would keep the piece out. But suppose a new weapon system required precisely such a 'scope?

"The contractor wouldn't know that it exists and would proceed to design it at a waste of money—just what we don't want to happen," says Bernstein.

He adds: "Improper standardization is the enemy of progress. There is a danger of retaining something beyond its obsolescence. TIF can be a help to progress if it is kept up to date and is kept fluid."

Fluidity will, as a practical matter, be largely in the hands of contractors. They will be the medium of contacti suppliers, who will be requested to f out TIF data sheets on equipment th is being incorporated into a missil aircraft support system. Any changes the system eliminating equipment changes in the equipment will neces tate updating of TIF data sheets.

On equipment that is under develo ment, data sheets, must be revised the item progresses to the operatior stage. Printing and distribution to abo 2600 contractors and AF procureme officials is handled by OCS.

AMC officials feel that TIF shou have a chance to be tried for seve months before any revisions are ma in the approach, particularly as gards the number of listed items.

"The reason we got together on T in the first place," comments one, that contractors complained that stock lists were too unwieldy to wo from. Let's keep the catalogue sm and see what happens."

X-15 Is Powered by Two Novel Generators

SCHENECTADY, N.Y.—Two unus 40-hp generators furnish the o power aboard the *X-15* space resea plane during glide tests. The u operate completely independent of plane's rocket engine and furnish p er to keep the pilot alive and cont the vehicle during descent and landi For fuel, they use hydrogen peroxi which decomposes into steam and o gen to drive a high-velocity turb producing both electric and hydra power.

Electric power from the Gen Electric units is used to energize plane's instrumentation, provide ca and pressure suit heat, power inertial guidance system and comp ers, and operate communication, t metering, and recording equipm Hydraulic power operates speed bra landing flaps and control surfaces.

Whirling Gas Gouges Nose Cones, Meteorites

SCHENECTADY, N.Y.—A Gen Electric scientist has come up wit convincing explanation of why s iron meteorites contain deep cavi that appear to have been made v a cutting tool.

Dr. R. H. Johnson says that stu of nose cones at hypersonic spe show that whirlpools of hot gas f in imperfections in the surface of cone (or meteorite) and cut like h speed tools to gouge out deep cavi

He contends, too, that this could count for the fact that some meteo fly apart during atmospheric entry.

Notch Sensitivity Wall Will Crack

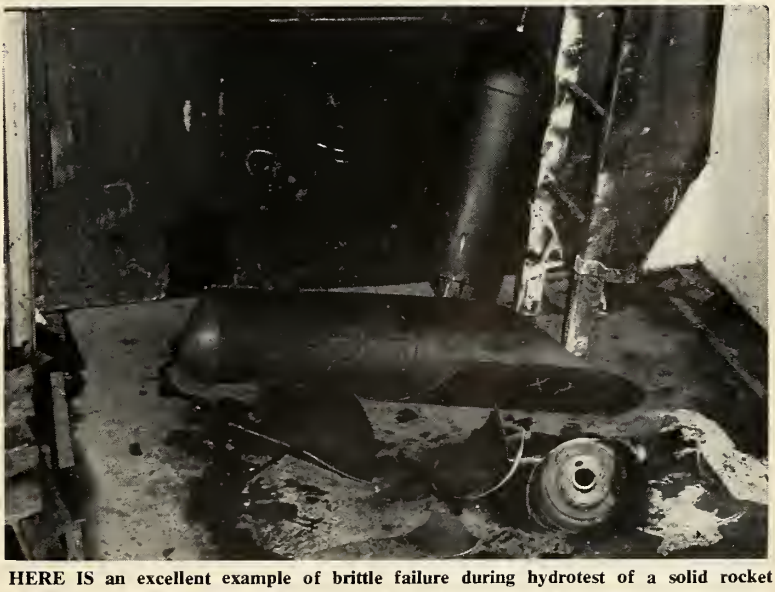
Large diameter rocket motor cases with 300,000 psi min-yield strength may be in production within a year through use of promising metallurgical techniques

WASHINGTON—If claims could fly, e'd be all manner of high-strength, -wall solid rockets in the air—each a motor case strength-to-weight o in excess of 1 million inches. Not that, but there'd be a free and al choice of materials including doz- of alloys of aluminum, titanium steel—each better than the others. nd the fabrication methods! All ld be "best" and would include d and welded, girth welded, stacked s, deep drawn, deep drawn and ded, hogged out, cold spun, hot , convolute wrapped, spiral pped, press extruded, sprayed metal, We'd be in missile heaven if claims d fly.

But they can't. And, by themselves, can't win contracts either. It used e that a company with a name, a n and an adeptness at the fine of pitchmanship could almost be red of a development contract to eve that shining 240,000 psi mini- n-yield-strength "next goal"—which , in those days, more than we ded, "just for good measure."

Now, as many a sadder (cancelled and wiser motor case manu- rer can attest, those days are gone ver. Years and millions of dollars , the "next goal" is down to a erate 220,000 psi. Yet the need is er to 300,000 psi. We're talking imum yield strength in large di- ter production cases—flight hard- e—not midget motors or the occa- al research program freak.

• **200,000 psi to be exceeded**—The 000 psi min-yield barrier to solid et motor case development is going e cracked within months. After that 000, 230,000 and 240,000 will fol- in rapid succession. And, before her year is passed, large-diameter 000 psi min-yield cases may well noving into the production phase.



Claims, tricks and fancy talk won't what does it. Rather, it will be ac- plished with a sound understanding of the problems involved; by a better-than-ever knowledge of the finer points of metallurgy; and with a craftsman-scientist-artist's approach to fabrication.

It won't be job-shop metal-working or a big-dollar scatter factor that turns the trick. Gone are the days when the gross approach to technology was all it took to cop new honors in metallurgy. Instead it will take the same intimate understanding of this art as that which has enabled such great strides to be made in other phases of missilery, such as guidance, control, re-entry, etc.

No one can detail for sure just what form the breakthrough will take when it comes, even though the alloy(s), treatment and fabrication method(s) may now be in the development stage. There are promising results already, but nothing has been proved out.

Importantly, however, the arsenal of basic do's and don't's and promising metallurgical concepts is not only growing rapidly, but beginning to take coherent form and point the way to a breakthrough.

• **Notch sensitivity concept**—Perhaps the most elementary of these is the concept of notch sensitivity (M/R, June 8). This says, in effect, that high-strength alloys heat-treated to their optimum high strengths will have a very low tolerance for even very small flaws. It goes on to say (based now on a great variety of experimental research and testing) that if, on the other hand, an alloy is heat-treated to a lower smooth tensile strength (and more ductile condition), its toler-

HERE IS an excellent example of brittle failure during hydrotest of a solid rocket motor case. Failure in this case was at less than one-half the values of the tensile coupons that accompanied the chamber through heat-treat. It burst at 1000 psi hydro pressure. The material, a 5% chrome hot-worked die steel, exhibits all the characteristics of a notch-sensitive failure.

ance to flaws will be greater, and the material in the notched condition will be stronger. It is against this basic concept that current motor case development is proceeding.

No material tested so far shows a notch strength in excess of 210,000 psi. Most are below 200,000 psi. The mean is 190,000 psi. This would seem to rule out any chances of breaking the 220,000 mark without developing materials that either weren't notch-sensitive or had notch strengths in excess of that mark. Fortunately, however, this isn't so.

• **Two assault forms**—The assault on notch sensitivity takes two basic routes:

The assumption is made that, on a production run, flaws are inevitable, and efforts are being made to design and fabricate accordingly.

Considerable effort is being expended both by steel-makers and motor case manufacturers to develop basic materials and fabrication techniques to minimize the possibility of flaws in the finished product. Simultaneously, efforts are being made to develop inspection techniques (unavailable now) to reliably detect these flaws—which take many forms and need not exceed a maximum dimension of 0.010" to prove fatal.

Accepting notch sensitivity as inevitable requires a more highly refined approach to stress analysis, if the 200,000 psi mark is going to be topped. This is the first step in designing to high notch sensitive strength in motor cases, and is an approach that apparently is still not too widely appreciated.

Most material min-yield and ultimate tensile strengths are stated on the basis of results obtained from pull tests on straight strip samples of the material—notched or not, depending on the test. In this test, the strip is grabbed by jaws at either end, and tensile stress is applied until (a) the material exceeds its elastic limit (min-yield stress) and (b) it fractures (ultimate tensile strength).

Traditionally, motor-case design procedure had been to take these simple coupon strengths and put them into the formula $s=pd/2t$, where s is the hoop stress; p, the hydrostatic test pressure; d, the motor case diameter: and t, the motor case wall thickness. (Formula for longitudinal stress is $s=pd/4t$, which makes longitudinal stress just half of hoop stress). Motor case wall thickness is determined by hoop stress only.

With a certain chamber pressure dictated by propellant chemistry and burning geometry and with a material of a given min-yield strength (based on the simple pull test), the motor case designer for the most part has simply added his safety factor (say, 20% higher pressure) and solved for wall thickness. And that's how his specifications have gone to the case manufacturer.

• **Why it costs**—But this is the gross approach to both motor case design and stress analysis, and, in part, it's one of the things that has cost us so much money, time and frustration.

It also may be why so many cases that were heat-treated to a hardness of $R_c=53$ burst as though they had been heat treated to $R_c=74$. The condition of the material is not the same under bi-axial stressing as from the combination of hoop and longitudinal stress—as it is under uniaxial loading, as in simple pull test stress. Under stress a material tends to strain (stretch). This means the cross-sectional area is reduced. However, apply a second stress 90° (normal) to the first, and it resists natural strain tendencies.

In effect, biaxial stressing appears to have the same result as a te porary embrittlement. Though this not a conclusive fact yet, work date supports the concept, and mo case development work is proceed accordingly.

For example, in comparative t between uniaxially loaded pull-test c pons and biaxially loaded cylindri pressure vessels, cylinder min-yi strengths have consistently excee those of the coupons. Also, the yi to-tensile strength ratio of the cylin has increased, meaning that the cy der's min-yield strength has gone more than its tensile strength—a ch acteristic of embrittlement.

• **Here's secret**—It is in this hig min-yield strength for cylinders t the secret of designing around nc sensitivity lies. It makes use of the Mises-Henckey Maximum Strain ergy Theory which, in effect, says the minimum yield strength of a cy der will be 1.15 times that of a test sample of the same material h treated to the same unstressed hard as the cylinder. The formula for thi $s_0^2 = (s_1 - s_2)^2 + (s_2 - s_3)^2 + (s_3 -$ where s_0 is the coupon min-y strength; s_1 is hoop stress; s_2 is lo tudinal stress ($s_1 = 2s_2$); and s radial stress (and in a thin-wall ch ber equals zero).

What all this means is this: If take a material with a maximum n

Steels Researched for Solid Cases

Here are various steel alloys now being researched as best candidates for use as solid rocket case materials. Note the generally low carbon content of most of them; and the often-high silicon tent—both representing approaches to low notch sensitivity.

gth of 200,000 psi (of which there several), fabricate it into a motor , and then heat-treat it to a maxi- n notch coupon min-yield strength),000 psi), you will have a 230,000 yield motor case (1.15 times 200,-). This comes from substituting 200,- for s_0 in the above formula and ng for s_1.

• **Choice is steel**—In choosing ma- ls to meet high-strength motor requirements, with certain specific- ication exceptions, the big choice eel—any one of over two dozen s (see accompanying tables). Of e maybe half a dozen have usable h strengths in excess of 200,000 None has been proven to exceed 000 psi.

Aluminum for the most part hasn't considered for large diameter rocket motor cases because of its ively low modulus. However, on trength-to-weight ratio basis it's st an even-Steven competitor with . And Alcoa's new X-2020 alloy bits very favorable strength prop- ts at elevated temperatures. With fabrication techniques being pro- d, aluminum may yet get in the ing.

Titanium apparently is way out of field, not only due to the diffi- y in fabricating it, but also be- e it is very inconsistent in its re- se to heat-treatment. And, at the gth levels being considered, all als must be heat-treated.

Two of the most promising alloys being tested in solid rocket motor s are X-200, a low carbon air- ening steel, and MBMC 1. Both U.S. Steel developments, and give minary promise of much improved h sensitive characteristics, i.e., high h strengths.

One thing to watch out for: make ain heat-treat temperature exceeds designed environmental operating erature of the motor case. This ns, almost without exception, heat- ing to a hardness of under R_c=50, s desirable in obtaining high notch gths.

Efforts to eliminate flaws, and thus around notch sensitivity by ending with no notches, concentrate pri- ily around fabrication techniques. erally speaking, the more a ma- l is worked, as in rolling or spin- , the more flaws tend to be worked It's rather like getting large air les out of bread dough by knead- it. If the metal is worked enough, usions and inclusions, local brittle s and other discontinuities can be ded out and made homogeneous the parent metal.

• **Success in spinning**—This is the n reason such marked successes e recently been achieved by spin-

Rate of Change

This table shows typical rate of change of the notch tensile to smooth tensile strength with increased strength in the smooth coupon test sample. X-200, 300-M and UHS-280 are three typical steels being tested now for use in solid rocket motor cases.

Yield Strength —psi @ 0.2%	Sharp Notch to Tensile strength ratio	Test grain Direction	Tempering Temperature
	X—200		
180,000	0.95	L & T	1175°
210,000	0.81	L & T	1075°
225,000	0.43	L & T	975°

ning motor cases. Typical procedure here is to start with a forged (and perhaps machined) blank whose inside diameter equals that of the finished case, whose length is half and whose wall thickness is twice that of the finished product. Then, in one-to-three passes with spinning equipment (Hydrospin, Hydroform, Flo-Turn, etc.), the metal is literally pushed into the desired configuration. Though greatest success so far has been achieved with cold spinning, impressive results have recently been reported by at least one contractor with hot spinning—where the blank is heated before each pass.

Spinning used in combination with other fabrication techniques (which unfortunately cannot be detailed at this time) has produced the best results. One Navy (*Polaris*) engineer is convinced the best cases for both *Polaris* and *Minuteman* will be spun.

The old, well established technique of either cold or hot working welds goes a long way towards minimizing the notch effects of under-bead cracks and normal cracks in welding.

Care should be taken to determine the cracking tendency of the material being welded (whether under-bead or normal), in order to align the crack direction normal to the longitudinal (lowest) stress vector and design the case (or pick materials) accordingly.

Insofar as notch sensitivity is concerned, a notch is any discontinuity in the body of the material or in its contour. For this reason, it is almost mandatory in welded cases that the weld bead be ground flush with the rest of the case.

Sharp corners in design should be avoided wherever possible. Anything that tends to produce a bending moment when the case is pressurized is dangerous. This includes ovality in the unpressurized case, which wants to "bend" into the round configuration under pressure, or a dent. The latter can cause local stresses double those in the undented case.

In some instances the material supplier tries to take the notches out before it ever gets to the fabricator. One approach to this is U.S. Steel's sandwich rolled sheet where several layers of plate are rolled as a laminate. Advantages claimed for this technique are: cross rolling; reduction in directional differentiation of grain structure; minimization of inclusions in any direction; high surface density; freedom from normal surface flaws; better decarburization control; closer tolerance control (thickness held to 0.0205" to 0.0215" in 130" wide sheet). Burst tests with small welded cylinders are being conducted now.

Controlled decarburization has, itself, been suggested as a means of minimizing notch sensitivity—particularly due to surface flaws and scratches. Theory here is that more ductile surface makes it easier for stress relieving plastic deformation to take place.

• **Here are "buts"**—One final word of caution: minimize hydrotesting. If there is any tendency towards notch failure—crack propagation—hydrotesting will intensify it. Ideally, it would be best to inspect all flaws out of a motor case and thus make even one hydrotest cycle unnecessary.

But this not being possible, the compromise generally being adopted is three static tests of three minutes each. Value of a dynamic (surge) test is seriously questioned, since materials at the strength levels being considered generally are not strain-rate-sensitive.

Obviously, a lot more is being done to eliminate or get around notch sensitivity. But basically all specific approaches fall within the general parameters outlined above. Little has been said about strip (spiral) wrapping with very thin (0.015" thick), high-strength (300,000-to-500,000 psi ultimate) strips, since serious problems remain in attaching forward and aft closures, and current organic bonding techniques make spiral wrap cases subject to strength failure under aerodynamic heating.

Drag Brake Proposed for M-I-S

Avco says ICBM research and aero-medical progress have made possible design with advantages of simplicity along with lightweight and reduced production expense

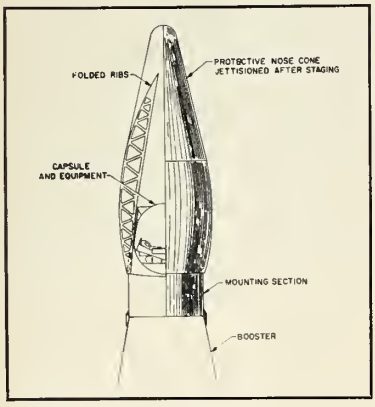

FIG. 2—Drag brake satellite vehicle mounted on *Atlas* booster for launching.

EVERETT, MASS.—Details of a manned satellite design based on a drag brake—rather than retro-rockets as planned under NASA's Project *Mercury*—have been revealed by Avco's Everett Research Laboratory.

Under Avco's system, which has been under research for three years, the drag brake would perform all functions now in a retrorocket system: orientation of vehicle, retrorocket with autopilot, heat shield, and a sequence of decelerating parachutes.

In announcing the system, Avco scientists pointed out that manned satellite designs which have been discussed publicly are adaptations of airplane or nose cone technology, and that the re-entry heating problem and the deceleration which must be faced by a human passenger have domina most manned satellite discussion.

However, Avco said that prog made during the ICBM program allowed the company to design a hicle without over-emphasizing re-e heating considerations. Furthermor added, progress in aero-medical search makes it clear that the 8 g celerations which must be faced i tangential constant drag re-entry not a serious problem either, should not dominate the design.

While the retro-rocket design proach to Project *Mercury* was cited in research details furnished Avco, retro-rocket systems were u as a comparison.

• **Advantages**—In summarizing advantages of the drag brake sate recovery system and its space fl potential, Avco said its "multipli of functions" leads "to several ad tages over other recovery syst which all require separate subsyst to perform each function."

These advantages were cited:

1. The system—when operati —will, because of its simplicity, s a greater reliability because the ability of any system can be onl large as the product of the reliabil of all its subsystems.

2. Since there is only one m component, the development will quire less time and will be less c than the development of the sev subsystems of other satellite reco systems.

3. The operational aspects of orbital flight with a drag vehicle be far less complicated. Avco p out that a retro-rocket system requi a device which maintains accurate entation of the vehicle; a retro-ro plus its auto-pilot; a heat shield w may or may not need to be jettiso and a final landing system consis of a sequence of parachutes which

FIG. 1—Model of Avco drag brake. Mechanical engineering and structural design by All American Engineering Co. in cooperation with the Avco-Everett Research Laboratory.

ving the vehicle down at about
)00 ft.
4. Control aspects of a drag brake
cle will not require accurate
wledge of the orbit, and the track-
requirements are much reduced
n those of a retro-rocket system.
5. The drag brake has inherent use-
ess in the circularization of highly
tic orbits, and
6. The vehicle will have a distinct
ght advantage over other re-entry
cles. Avco said the weight required
a drag brake vehicle to recover a
n payload is less than half that
uired by a retro-rocket system, and
use of a good ablating heat shield
the retro-rocket design would re-
e the drag brake vehicle weight
ntage by 100 to 200 lbs.

• Details—Here are design details
urnished by Avco:

The manned satellite design is built
nd a stainless steel drag brake (Fig.
Opening and closing the structure
rbit results in a 20:1 drag varia-
This variation causes a corre-
nding change in the rate of descent
rbital lifetime.

Controlled variation of the drag
rding to a preset program will
nit landing at a pre-selected point
an accuracy of ± 150 nautical
s. The extended structure has a low
ing, 1½ #/ft², and consequently
vehicle decelerates high in the at-
here, radiating the heat away at
eratures which never exceed
ent gas turbine practice.

The drag brake also yields a ter-
l velocity low enough so that no
ional parachutes are required for
ing at ground level.

During launch the drag brake satel-
is mounted on the booster in the

ractor type escape system is
nted at the forward end of the
The drag brake is covered by a
ective nose cover. At staging, when
vehicle is essentially out of the
e part of the atmosphere, the nose
r and escape system are jettisoned.

• 105-mile orbit—The booster ve-
accelerates the satellite until the
er velocity vector has been
ved. At this point the satellite
booster are separated and the drag
e vehicle starts its journey in space.
The satellite would be launched
a 105-n. mile near-circular orbit,
ing a lifetime of two days in the
drag or closed position of the
brake—and permitting emergency
ery in two hours.

Avco pointed out that emergency
ery times of less than the orbital

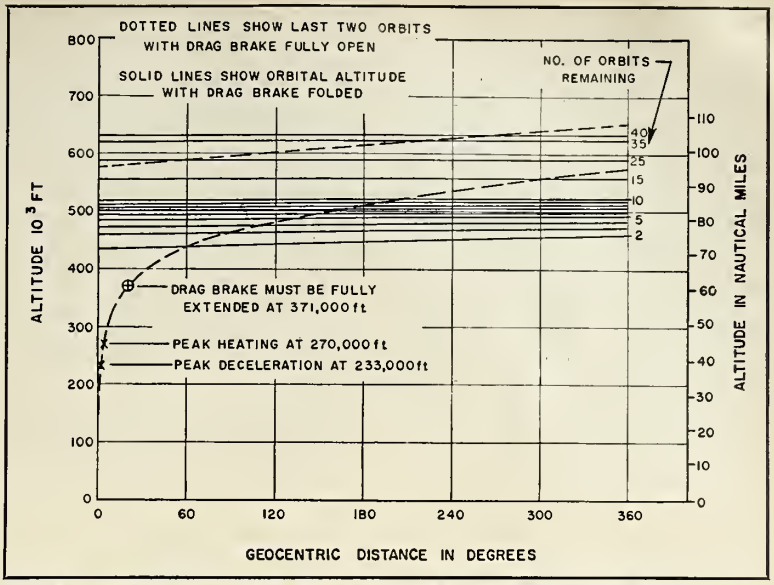

FIG. 3.—Landing point control by drag variation. The difference in descent rate or orbit decay is shown for a 20:1 drag variation from $W/C_DA \pm 1.5$ to 30.

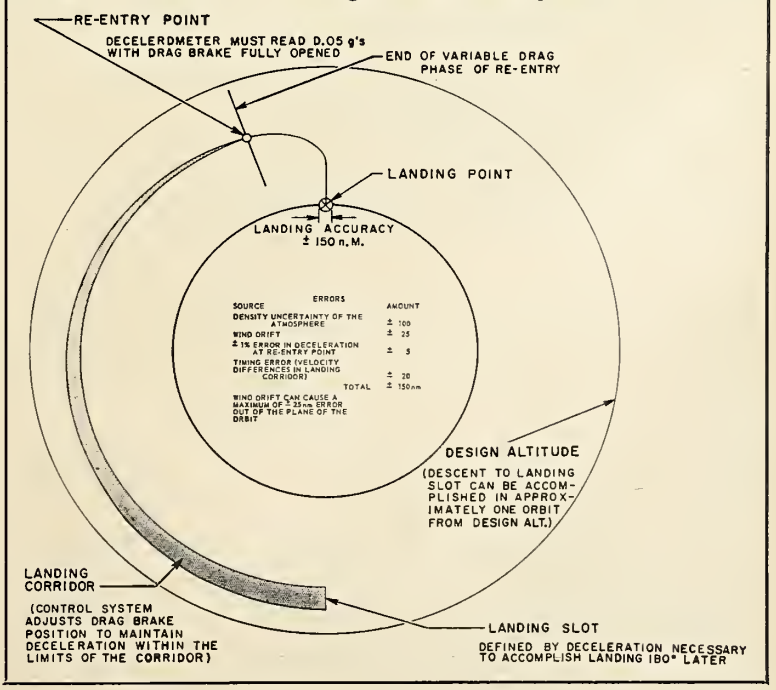


period "do not make sense" because recovery must be effected at a specific point in every orbit in order to minimize the vast problem of location after landing.

At 105 n. miles, the small but distinct amount of residual atmosphere will exert forces on the vehicle. Because of the large extended structure, even in the closed position these forces are sufficient to exert the necessary movements to orient the vehicle into the air stream, Avco said. The period of this motion at 105 n. miles altitude is several minutes.

For a drag brake satellite, re-entry is made up of a number of distinct phases. First, the satellite descends from the orbital altitude to the region from which a controlled re-entry is made.

Next, the drag is controlled accord-

FIG. 4—Landing Point Control System

ing to a preset program for about ½ orbit in order to achieve a given velocity vector at a particular point. Finally, the drag brake is fixed in the open position at the onset of serious heating and the vehicle passes through the heating and deceleration peaks and achieves terminal velocity at about 200,000 ft. From here down the vehicle drifts at terminal velocity and lands at 50 ft./sec. at sea level.

The principal of operation of the variable drag landing point control is shown in Fig. 3. Concept is that the descent rate or lifetime of decaying satellite orbits can be changed significantly by changes in the vehicle ballistic parameter, W/C_DA.

For instance, from an altitude of about 90 n. miles one can re-enter in as many as 15 orbits or in less than one orbit, depending on the drag brake position, i.e., ballistic parameter, W/C_DA.

In fact, Avco said, in the geometric mean drag brake position, and only 3000 n. miles from the landing point, the landing point can be altered by approximately plus 2000 and minus 1500 n. miles.

• **Control philosophy**—A detailed control system philosophy which operates on the above-stated principle has been developed. The system depends on two simple measurements: time and acceleration. The time serves to locate the vehicle with respect to the landing point.

As long as the satellite is still in a nearly circular orbit, the orbital period is essentially invariant with the small ellipticities due to drag and drag variations. Thus the timing from either th insertion point or from a later fix lo cates the satellite accurately. This rela tionship holds until the onset of larg deceleration forces. Thus ideal or nom inal drag variation with time can b established for the controlled dra phase of re-entry.

A body-mounted accelerometer measures this drag and compares it t the measured drag and to the nomina value desired. The control system ca thus sense whether the drag is correct too high, or too low, and can produc signals which vary the drag brake posi tion so as to eliminate the differenc between the nominal and measure values. Avco said this system does no require accurate information about th orbit and therefore tracking require ments are simplified.

According to Avco, the system capable of correcting the effect of ellip ticity, altitude error at the start of th controlled phase, errors in the know edge of the upper atmosphere an density variations of either the latitud or diurnal type.

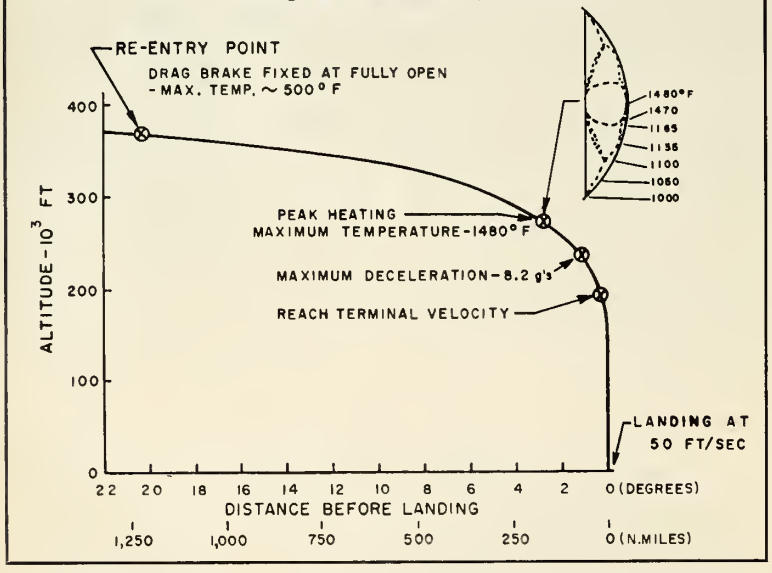
The result of an error analysis fixe a density range from which the contr system can achieve a landing poin accuracy of plus or minus 150 miles in the orbital plane. This indicated by the "landing slot" show in Fig. 4. During the controlled phas the satellite flies within the "landin corridor," correcting the drag brak position in accordance with the contr system dictates, until it achieves th proper velocity vector at the re-entr point.

• **500°F temperature**—From th re-entry point to final touchdown r further functions are required, Avc said. The nose of the capsule will he up to a temperature of about 500° when the vehicle is only 1000 n. mil from the final landing point. Up to th point the linear relationship betwee distance and time will have been acc rate to 20 n. miles. At the low dra parameter, W/C_DA, of 1.5 peak hea ing occurs at a very high altitude ar consequently the heat transfer rat and the radiative equilibrium temper tures will be relatively low.

The maxium temperature encou tered by the structure at the capsu nose surface will be less than 1500° assuming an emissivity of 0.85. T drag brake surface, which can radia from both the front and rear surfac should not exceed an equilibrium te perature of 1200°F.

At peak heating, at 270,000 ft. al tude, the deceleration will be abo four g. After peak heating the decele tion will continue to increase a should reach 8.2 g at 233,000 ft. T time above eight g will be aproximate 20 seconds and should be well with

FIG. 5—Drag Brake Re-entry Conditions



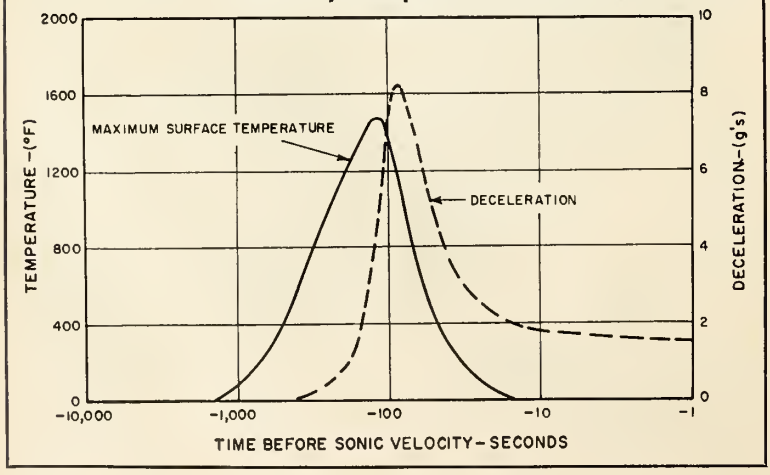


FIG. 6—Re-entry Temps & Accelerations

established limits of human endurance. At peak deceleration the maximum temperature will have decreased 1130°F (Figs. 5 and 6).

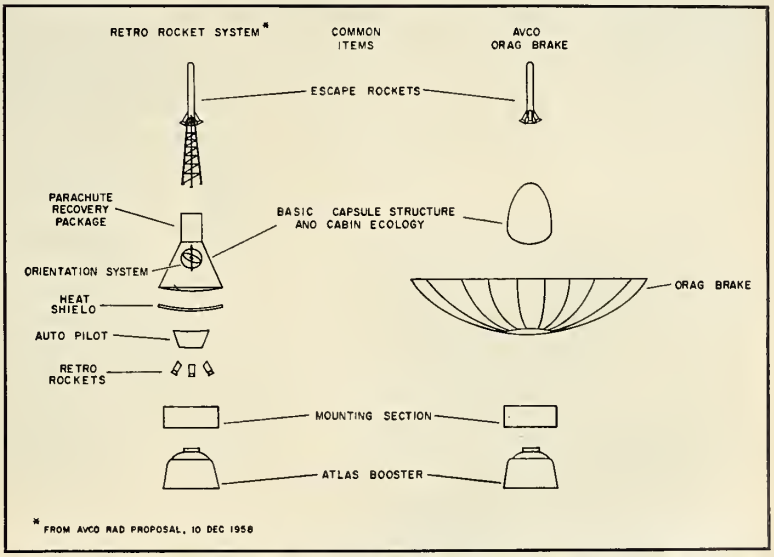
Avco said the relative time of occurrence of the peaks of heating and deceleration points out an interesting possibility for future drag brake vehicles. If at the instant of peak heating (i.e., 4 g) the acceleration is held constant by retracting the drag brake slightly, then the peak re-entry g can be reduced to four—without any increase in maximum temperature. The peak heating condition would merely be held for a somewhat longer time, which does not penalize a radiating re-entry vehicle structure.

The drag brake will continue to decelerate and will approach terminal velocity just under 200,000 ft. The terminal velocity will decrease with increasing air density until at sea level the vehicle will land at 50 ft./sec. During the terminal descent, which takes approximately 15 minutes, the large metallic surface should be an excellent radar target for tracking and locating the vehicle at the landing.

• **Mechanical details**—The mechanical problems of building a drag brake satellite system have been faced in considerable detail. The device consists of four basic components, i.e., the ribs, the covering material, the actuating mechanism and the capsule. Of these the ribs represent over 50% of the total weight of the drag brake.

The total weight of the ribs could be reduced by decreasing their number, Avco said. However, the consequent departure from a true spherical surface due to the scalloping effect of the covering between the ribs would increase the heat transfer on the ribs. The ribs are .020" stainless steel beams with reinforcing cap strips. Buckling due to compression of the cap strip is the most critical design condition.

The covering material should be as light as possible, Avco points out. Stainless steel cloth made of .001 wire woven into a close, 400 x 400, mesh is commercially available, and this material meets all the requirements except that it is somewhat porous. Even a small amount of porosity increases the heat transfer on the drag brake significantly due to the removal of the cool boundary layer air blanketing the surface.



Several methods of reducing the objectionable porosity are under consideration. It is presently possible to build up a drag brake skin out of a layer of the above cloth, a layer of thin (.005 inch) solid sheet but cut into circumferentially aligned ribbons or shingles, and another layer of cloth of coarser mesh.

The shingles will eliminate the porosity, yet are flexible enough to satisfy the folding requirements. The two layers of cloth maintain the shingles in place and prevent tearing. The air loads can actually be transmitted to the ribs by any one of the three layers alone.

• **Actuation choices**—The actuating system and capsule do not represent serious design problems, Avco said. It is mostly a question of arriving at the lightest and simplest structure for each. Actuation can be either pneumatic, electric or mechanical. A two-way pneumatic system is proposed.

• **Would-be sphere**—The optimum pressure vessel, i.e., a sphere, is very nearly a compatible shape for the drag brake vehicle. Only a slight conical section need be interposed between the spherical top and bottom halves. The conical section is extended both up and down to form the hinge points for the drag brake. This capsule weighs only a few percent more than an equivalent spherical vessel.

Avco said that in this design the configuration was dictated by the orbital, re-entry and escape conditions, rather than by the sea level landing speed. The resultant landing velocity of 50 ft./sec. is somewhat higher than has been proposed in other satellite designs. However, Avco believes that the decelerations on the passenger can be kept at a level equivalent to a 30 ft./sec. landing by a shock-absorbing structure similar to aircraft arresting gear. This can be accomplished, Avco said, at the cost of far less weight than would be needed to reduce the landing velocity by geometrical changes or by adding recovery parachutes.

FUNCTIONAL comparison of the Avco drag brake and a typical retro-rocket system. Company says brake's "multiplicity of functions" gives it "several advantages."

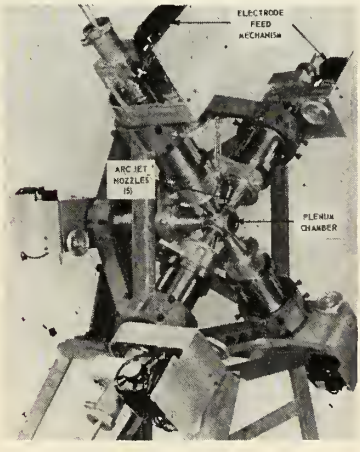
Re-entry Stresses Simulated in Lab



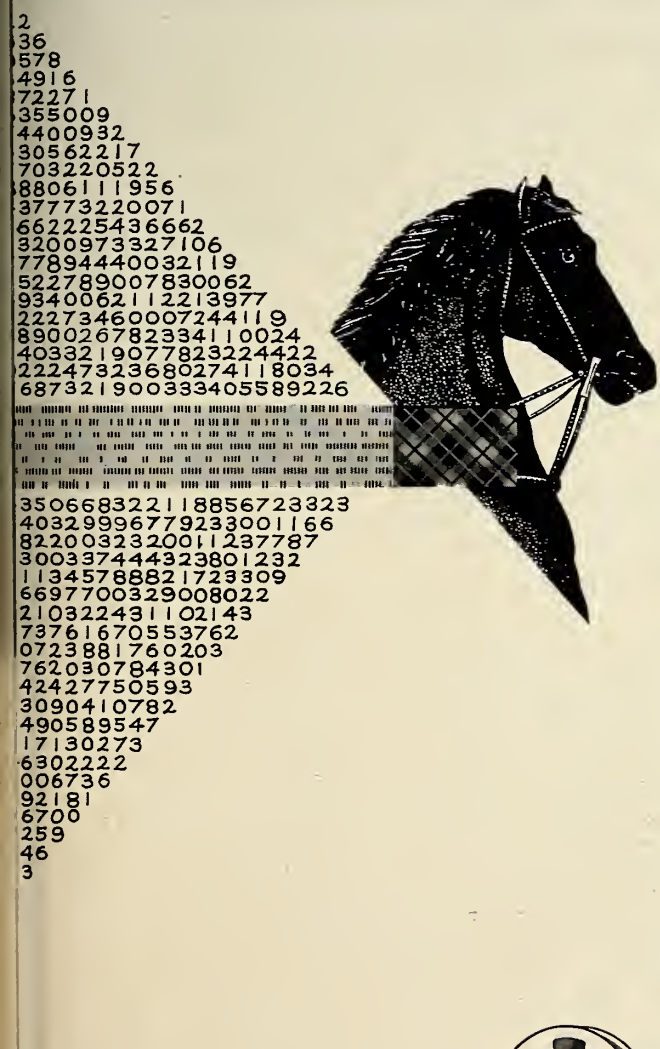
EVERETT, MASS.—A 10-megawatt high-pressure arc plasma generator which realistically duplicates the pressures and temperatures met by ICBM nose cones and satellites on re-entering the atmosphere has been developed by Avco's Everett Research Laboratory.

The unit uses five arcs instead of the usual one to generate this tremendous power. Each of the five nozzles is separately powered and water-cooled. The giant generator itself is powered by 2000 12-volt truck batteries.

The facility was developed by Avco as part of its research and development program on ICBM nose cones. Models are subjected to the high-velocity, 15,000-degree plasma jet to evaluate the performance of ablating materials and heat sinks under re-entry conditions.

AVCO technician prepares the arc wind tunnel for firing. Confusion of pipes, tubes and cables supplies the device with water, air and power.

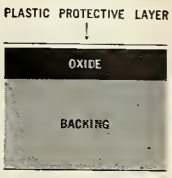
JET NOZZLE assembly. Each of the five jets, powered by arcs from water-cooled graphite cathodes, discharges hot plasma into central copper plenum chamber.



TEN MEGAWATT arc jet in operation. The jet, containing five to six million watts of energy, issues through supersonic nozzle.

NEED A TAPE WORKHORSE?

"SCOTCH" BRAND Sandwich Tapes

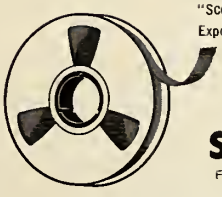


wear longer, cut head maintenance even in digital work

Tote that tape—change that reel—clean that head! If your project atmosphere sometimes seems that way, "SCOTCH" BRAND Sandwich Tape comes to the rescue. How about the possibility of getting over 50,000 passes out of a computer tape? And if that sounds attractive, consider the value in a tape that has no rub-off, won't give you any head buiid-up, drastically reduces maintenance and replacement on costly head assemblies.

One user found that the simple change to "SCOTCH" BRAND Sandwich dramatically reduced head replacements. And—where heads previously had to be cleaned after every run, "SCOTCH" BRAND Sandwich Tape cut cleaning to once a week.

The secret's in the Sandwich—the high potency oxide magnetic coating is sandwiched between the tough polyester base and a thin protective plastic layer. The coating never contacts the head—you get smooth, low-friction tape movement, plus an end to rub-off, head build-up, and a reduction in erosion of the critical slit in the recording head. Though the 50 micro-inch protective layer causes some slight reduction in high frequency response, the plain facts are that Sandwich Tape packs up to 600 pulses per inch in digital work—has broad usage in AM, FM, or PDM applications.



In "SCOTCH" BRAND Sandwich Tape you have a tape workhorse, pulling a big load over long distances. One user reported fewer drop-outs with each successive pass. As his recording heads were cleaned, the contaminates proved to be in the system, not the tape. Speaking of drop-outs, beware the villainous cigarette—often a culprit. One careless gesture and an ash can cause 40 to 60 drop-outs.

Whatever your application — data reduction, acquisition or control programming — count on 3M technology to create tape of higher uniformity and reliability for error-free performance.

"SCOTCH" BRAND High Output Tape No. 128 gives you top output at low frequencies, even under extremes of ambient temperatures. "SCOTCH" BRAND High Resolution Tape No. 159 lets you pack more bits per inch, offers extra playing time. Finally, for top performance at low cost per foot, "SCOTCH" BRAND Instrumentation Tapes Nos. 108 and 109 remain the standard for the industry.

Where there's no margin for error, there's no tape like "SCOTCH" BRAND. For more details, write Magnetic Products Div., 3M Company, St. Paul 6, Minn., or mail the reader inquiry card. © 1959 3M Co.

"SCOTCH" is a registered trademark of 3M Company, St. Paul 6, Minnesota. Export: 99 Park Avenue, New York, N.Y. In Canada: London, Ontario.

NASA Space Lab Plans Outlined

ARS meeting also hears debate on the long-term value of Project Mercury 'holding facility' and reports on ramjet, ion engine and APU developments

by Frank G. McGuire

SAN DIEGO—Planned as a "sounding board" for practicable ideas rather than a mere exchange of technical information, the American Rocket Society's 1959 semiannual meeting, June 8-12, provided an extremely well-managed forum for all types of astronautical ideas and problems.

The meeting, marked by attendance of some 2000 members and presentation of 115 papers, covered such broad topics as the economic impact of space technology, politics in the Space Age and the influence of astronautics on contemporary thought. But it also fulfilled its original role as clearinghouse for treatment of more technical subjects.

Scattered throughout the activities were such names as Whipple, Stuhlinger, Medaris, Yates, Douglas (Donald, Jr.) Stapp, Kaplan, Dempsey, Ehricke, Urey, Silverstein—almost all of whom presented papers.

A keynote was the solid reality characteristic of most papers. There was little "wild, wild blue yonder" speculation on imaginary or insignificant academic problems. Instead, there was a down-to-earth approach keyed to actual operational requirements, logistics, and costs. One of the first sessions, that on Logistics and Operations, was aimed at making R&D personnel aware of logistical and operational problems involved in space vehicles and weapon systems.

• **Balance demanded**—Most papers presented at this session were highly critical of our pouring millions of dollars into missile performance, while spending only a fraction of that amount in appropriate instrumentation. "Supporting facilities, such as are provided by our range and its instrumentation, are too often taken for granted," according to Maj. Gen. Donald N. Yates, commander, AFMTC, Patrick AFB, who added: "We have been driven into a frantic race with missile performance in our job to provide instrumentation of commensurate performance."

Other speakers echoed the general's remarks and pressed for a more balanced program, rather than one stressing only the "bird" itself. "We are now at the bottom of the barrel . . . in instrumentation development," Yates said. He declared that instrumentation has become the bottleneck of a development program, as far as time is concerned.

• **Solid-state future**—The electronics segment of astronautical engineering was warned that it, too, is approaching the "point of diminishing returns" in one phase of its field—component microminiaturization. "Fortunately," said Donal B. Duncan of Autonetics, "there is an extensive research effort which . . . can replace, not existing components, but existing circuits," with solid-state circuits.

These units, packaged as one, replace present devices in which components are packaged individually, then connected by wiring or printed circuitry. Duncan predicted an accelerated development of these solid-state circuits, bringing a major technological breakthrough within a few years.

The time will come, he predicted, when a small digital computer, now requiring decision, memory, and other circuits, will consist of a single block of material incorporating all these elements.

"The material might consist of a single thin crystal of a semiconductor with dimensions on the order of inches, which is modified by depositing on the surface various elements to change the lattice structure of the semiconduct or to modify in other ways the surfa characteristics. It is possible that t deposit of these various thin fil can be made by some automatic pr cess and that the time to modify t crystal so that it is a complete di tal computer can become a matter minutes," Duncan said.

• **Space observatory**—The propos launching of a 2500-pound orbiti space observatory by NASA came for some attention. The platfor mounting six telescopes up to 36 inch would be placed in a 500-mile orbit a two-stage configuration of *Vega* not less than two years. The prelimi ary planning stages of the progra have been funded, and several int mediate steps are in the works, su as orbiting a solar observatory satell of several hundred pounds at abo 300 miles.

The unmanned platform will designed to aiming accuracies of o second of arc, relying on a flywh system instead of control jets. T high accuracy would drop if men we put aboard—even the heartbeat of crew member could conceivably distu it. "Actually," commented Dr. Fr Whipple, "we're not even aware what disturbing influences on the pl form might be introduced by the blo flow of a crew member."

Objectives of the orbiting obser tory are several: to make a compl map of the sky; locate "cold" st presently not visible; and locate p sible planets in "nearby" space (wit 10 light years).

Aiming of the platform would by radio control from earth. The f wheels would be set in motion in desired direction at the proper tim then stopped at the correct point. destruct system would quite likely

ilt into the platform, or at least its dio, to eliminate it from the communications spectrum and to prevent becoming a hazard to future navition.

The six telescopes would all point the same direction, but use different ters. This would eliminate the need r a mechanical filter-changing system which might cause reliability problms if just one telescope were used. ife of the platform was estimated, preming realization of plans, at over 0 years.

• **"Holding facility"**—A not-previsly-publicized facet of the Project *ercury* program was brought out at e meeting in several technical papers. his was the "holding facility" concept volving pre-launch and post-launch olation of astronauts for training, ealth and psychological preparation d debriefing.

The holding facility is defined as "training and medical maintenance nter" for the space crewman. To its job—completely preparing the tronaut for his mission—the facility eally would be located close to the unch site; provide quarters for all supt personnel; and be equipped to odify life support gear, simulate nearace conditions, and carry out final reening and selection.

The holding facilities would give omedical personnel maximum opportnity to control and observe the asonauts' environment and behavior bere and after a mission.

It was estimated that for four to weeks prior to launch the astronaut ould be isolated from his family and dergo an intensive training period in mulators, centrifuges, and other deces. The holding facility now being nned for the *Mercury* program at pe Canaveral will be able to simule every parameter of the mission cept weightlessness.

Biomedical experts at the meeting d varying opinions of the holding cility. Some felt that the four to 12ek period was absolutely mandatory. hers, including Toby Freedman of AA, felt that the holding facility with s isolation concept would be fine for one-shot mission, but that if the aim continuing space flight for long pends of time, it should be made as n-special" as possible, while still aintaining the requirements necessary r successful completion of the mison. The amount of special treatment r astronauts was the main point of ntention.

• **Lamps for wives?**—Freedman's per conceded that it is worth every ort to keep the astronaut free from ease. But he questioned the wisdom an absolute quarantine. ("In short, ould our space pilot sleep with his

THE GRAND CENTRAL REPORT

Tennessee Gas Transmission Company and Food Machinery and Chemical Corporation, the parent companies of Grand Central Rocket, have extensive investments in the energy field. In addition to their interest in Grand Central, TGT is in the oil, gas, and petrochemical fields, while FMC has three other divisions in dimazine, peroxygen chemical and boron propellants as well as other fuel and related products.

It is the long-range plan of both parent companies to build a strong position in the energy field. Grand Central Rocket Co., as a developer and producer of solid propellants and solid rocket motors, is a vital part of this plan.

It is our goal to make Grand Central Rocket, under new and aggressive management and with the addition of major facilities, one of the strongest and most capable solid propellant rocket organizations in the country.

J. J. King

JOE J. KING

"On the other hand," maintained Lt. Bruce W. Pinc of AF Ballistic Missile Division, "We can't have this highly-trained man abort a mission simply because he has a middle-ear block from a cold which he picked up from his wife six days ago and didn't detect until the morning of launch."

• **Propulsion**—In the realm of propulsion, the meeting heard a profusion of highly-technical papers on all types of systems and problems.

Ramjet engines were viewed as an excellent answer to hypersonic flight, even though many obstacles must be overcome in their development. Better ramjet performance was predicted as Mach numbers go up.

The principal problem, that of temperature, was graphically stated when Richard J. Weber of NASA pointed out that the stagnation temperature at Mach 8 is 4500°F, or nearly half the surface temperature of the sun. Neither stainless steel nor such other currently available materials as molybdenum or ceramics can retain adequate strength at such temperatures.

Design techniques can, however, limit the structural temperatures to values that can be withstood by currently-available materials. Both regeneratively cooled ramjets and thermal-radiating ramjets have been considered for the dissipation of heat. The difficulty with the former is the larger amount of surface that must be regeneratively cooled, and the principal problem with the latter system is design of engine components, nacelles, etc.

The solid-propellant ducted rocket, basically a solid-propellant gas generator exhausting a fuel-rich gas into the combustion chamber of a ramjet, where it is further burned and exhausted, is also in search of heat-resistant materials. But it is considered profitably usable on a great many vehicles operating within the atmosphere.

The principal advantage would be the ability to achieve greater burning times than pure rockets, with low cost. In addition, high total impulse to gross weight makes the system attractive as a large ballistic missile booster. Also cited were its simplicity, reliability and high performance.

• **Ion outlook**—Tests of first-generation ion engines have shown that a number of engineering and scientific problems must be solved before these high-performance, low-thrust devices can be extensively used in space flight. According to Rocketdyne engineers, analysis has demonstrated that improvements in both the power-source-conversion and ion-source-accelerator systems must await development of scientific data not now available.

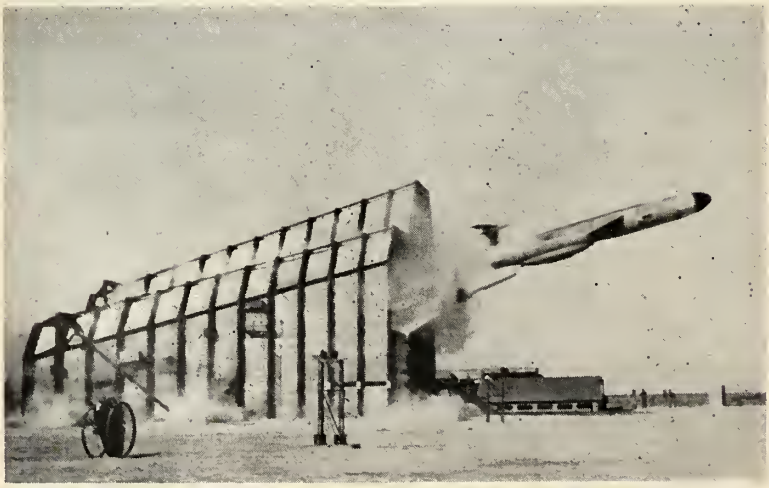
The accelerations produced by these first-generation ion engines will likely be less than 10^{-4} g, but they are advanced as useful engines for long missions, and some not-so-long missions. The coasting time of a chemical rocket to the nearest planet is about one year, and the low-thrust but lon duration ion rocket could make t trip in the same time.

However, a paper presented by e gineers at Electro-Optical Systems Inc cited problems—electrode destructio ionizing-surface poisoning, insulatic failure and loss of electrical power d to electron feedback—that must l solved before ion propulsion com into its own.

Some of the difficulties encountere in ion propulsion have been circun vented by extracting ions from the ic source at high voltage, then decelera ing them to the desired lower voltag according to ABMA scientists writi on the subject. This method wou avoid increasing weight, volume a complexity.

Materials problems were the prin item of interest at most propulsic discussions, mostly involving the ter perature and structure-strength cha acteristics of currently available a newer materials now under develo ment and study.

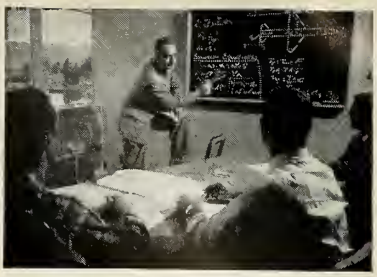
• **APU picture**—Auxiliary pow systems for space vehicles were most considered as eventually evolving in two types, solar and nuclear. Includ in a survey of feasible APU systen were: silicon photovoltic cells ("stan ard power system in 10 W-500 range"); solar thermo-electric ("pror ising"); solar thermionic-diode ("ve promising"); solar fuel cell ("promis high efficiency, much development r quired"), and solar turbo alternato ("very attractive about 3 KW. Need prove 6000-hour bearing life").



Nuclear power sources number four in the survey by JPL's Robe C. Hamilton: radioisotope therm electric or thermionic diode ("a tractive in 10 W-100 W range. Mo costly than solar power. Hazards." reactor thermo-electric ("promisi above 3 KW. Depends on materi research"); reactor thermionic-dio ("very promising. Cesium plasma r search promising. Multiple staging l ter"); reactor turbo-alternator ("ve attractive above 3 KW. Need to achie 6000-hour bearing life.")

Other sessions of great interest i cluded guidance systems, high-ener liquid rockets, high-performance pr pellants and vehicle program repor These, however, were classified.

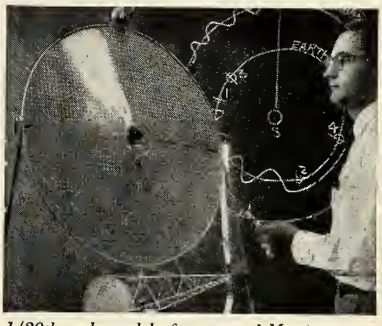
Tours arranged for members a tending the meeting included visits the *Polaris* underwater jury rig firir Convair-Astronautics, and a trip on missile ship with firings at sea.



Almost 60 exhibitors set up boot at the meeting, and a glance at t list showed a sizable majority of We ern representation, but a relatively hi percentage of firms from the Ea Coast.

The Reliable *Mace*

USAF TM-76 Martin *Mace* is launched from "simulated shelter" in recent New Mexico test. The bird has been termed the "most reliable" and "least complex" in the U.S. inventory by Maj. Gen. Daniel W. Jenkins of the Air Force's Tactical Air Command.



Boeing engineers work in small groups. Ability and initiative get plenty of visibility.

Test of ballistic missile propulsion system. Other tests cover space vehicle control units.

Environment for Dynamic Career Growth
for Engineers and Scientists

Ability is important in getting ahead in engineering and science. But of almost equal importance is the environment in which you work. A dynamic environment that provides challenge and scope, unexcelled facilities, and plenty of room at the top, can accelerate your advance to higher levels of responsibility and income.

This is the kind of environment you'll find at Boeing... pictured and described in Boeing's new 24-page booklet, "Environment for Dynamic Career Growth."

The booklet, in addition, reports on engineering and science assignments in connection with current Boeing projects—from advanced military and commercial jet aircraft to space vehicles, guided missiles and intercontinental ballistic missiles. It also outlines Boeing research and development activities, and documents the dynamic Boeing environment that fosters career growth of engineers and scientists.

There are openings at Boeing, now, for engineers and scientists of all categories, all experience and educational levels. A Boeing assignment in Research, Design, Production or Service could be the answer to *your* future.

NEW PROGRAM

Raytheon enters new weapons systems program and offers advancement opportunities for both Junior and Senior electronics engineers with experience in the following fields:

- Microwave engineers—component and antenna design
- Communications systems
- Guidance systems
- Computer systems
- Radar systems
- Inertial reference systems
- Feed-back control
- Auto-pilot
- Ground support
- Electronic packaging engineers
- Radar systems engineers (project management)
- Electromechanical engineer for missile control and auto-pilot design (project management)
- Mechanical engineer experienced in ground handling of large missile systems (project management)

You and your family will enjoy the many advantages of living in the metropolitan Boston area. Relocation assistance and modern benefits.

Please forward resume to:

Mr. W. F. O'Melia
Employment Manager
Raytheon Manufacturing Co.
Bedford, Mass.

or call collect:

Excellence in Electronics

Prospects for Thermoelectricity

Heavy investment in research gives hope for long-lived power units for space application

by Hal Gettings

WASHINGTON—Widely hailed as the t evidence that practical power gen- tion could be achieved by thermo- ctricity, the SNAP III generator nonstrated before President Eisen- ver in January was indeed a signifi- t development. Developed under the C's SNAP (Systems for Nuclear xiliary Power) program, this first t offers hope that small electrical rces can operate in space for long iods with no maintenance or re- ling.

The need for such units is obvious. nsidered only in the light of mili- y application, thermoelectric genera- n fills many desirable requirements:

1) Units with greater efficiency n present powerplants for shipboard base production of electrical power.

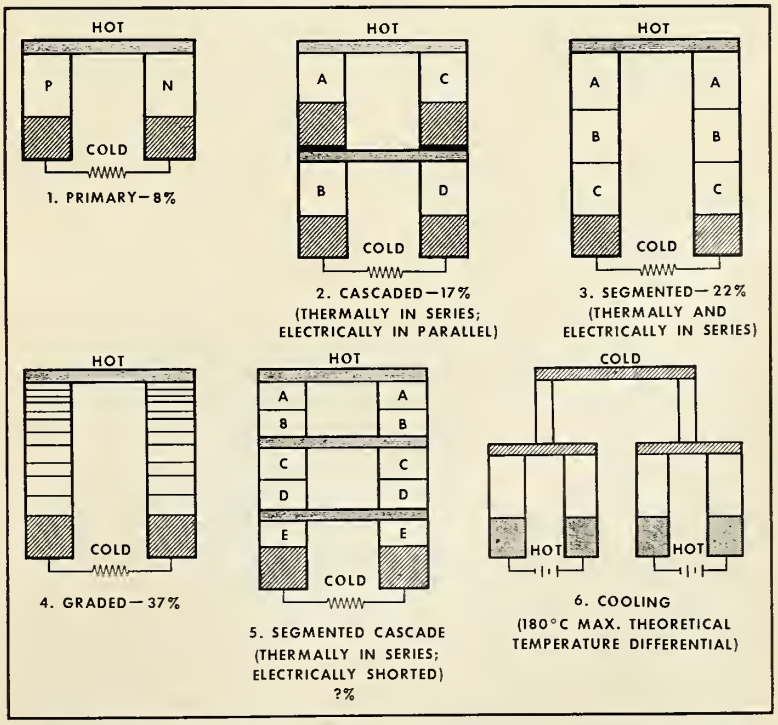
2) Units free from the noise of ving engine parts.

3) Small power units with high iciency and small maintenance re- rements.

4) Small power units for satellites spacecraft capable of using nuclear rgy and solar radiation.

5) Power units adapted to use non- ventional sources of energy such nuclear energy, solar radiation, and te sources of all types.

•Operating principles—The basic nciple of the thermoelectric genera- is deceptively simple: if the junc- ns of two dissimilar metals in a ed circuit are at different tempera- es, a current will be generated in h circuit.



This principle was first stated by mas J. Seebeck, a German physi- , over 125 years ago. In 1834, Jean ier restated it in reverse: a current ough the junction of two dissimilar als causes heat to be absorbed or n off. This is the "Peltier effect" he basis of electronic refrigeration.

Neither Seebeck nor Peltier really erstood what he had found, how- r, and except for Lord Kelvin's f by the principles of thermo- amic theory, nothing much was e for almost 100 years.

The diagram shows a basic thermoelectric circuit. To understand the principle even more clearly, one could imagine a box partially and uniformly filled with electrons. If one end of the box is heated and the other kept cool, the electrons at the warm end move around more and push toward the cold end. So long as new electrons are added (from the other member of the junction) and an electrical load draws off the excess that tends to pile up at the cold end, the current continues to flow. Heat is "pushing" the electricity. (By considering that the electrons carry some of this heat, a picture of Peltier heating and cooling can also be developed.)

• Commercial application—The Russians have been given much credit for their early application of the Seebeck principle. They developed a kerosene-powered generator for home radios, which received much publicity, and have also successfully applied Peltier cooling.

The first commercial application of thermoelectric power generation in this country was in the early 1950's and resulted from the experiments of Dr. S. Karrer, then director of research of the Baltimore Gas and Electric Co. Dr.

BASIC CONFIGURATIONS of thermoelectric generators. First three types in working and experimental stages. Graded (Type 4) requires development of technique to produce semimetal with linearally varying amount of impurities (from .0001 to .01%, for example) throughout length of material. Relative maximum efficiency figures based on given temperature differential.

Karrer later organized a research department at Baso Inc. and this group developed a doped lead-telluride junction that was capable of generating 10 times more power than the bimetal thermocouples. This binary compound exhibited the high thermoelectric power, low electrical resistivity, and low thermal conductivity requisite for an efficient conversion.

This device was successfully incorporated in heat-powered control valves for gas heating systems. Power generated by the thermocouple in the gas pilot flame electrically held open the main gas valve and provided fail-safe operation. (If the pilot went out the main valve closed and would not answer thermostat control.) The Baso valve is used today in practically every gas furnace and hot water heater.

The Baso research team, under Dr. R. W. Fritts, later moved to Minnesota Mining and Manufacturing Co. Here they applied the same basic device to the SNAP III generator; except now they used the natural decay heat of radioisotopes as a heat source instead of a gas flame.

When Martin, the prime contractor, ordered the thermoelectric generator for SNAP III from 3M—on a purchase order; not a research and development contract—it was practically an off-the-shelf item based on the previous eight years of development. Every issued or pending patent pertaining to the design and construction of the thermopile is today in the name of 3M.

Many companies—at last count, 837—are presently involved in thermoelectric research. All work for the armed forces is coordinated by the Navy's Bureau of Ships, a strangely reticent group which apparently makes a concerted effort to keep its name out of the public press. Whether BuShips is merely modest or is intent on developing their own in-house capability is not known. They have, however, a large and responsible part in thermoelectric progress and certainly deserve considerable credit for their work. They oversee today some $3 million in research and development contracts. Budget for FY 1960 is reported to be around $6 million with increasing amounts in following years.

•**Nuclear power application**—The SNAP III unit—two of which have been built—uses 1700 curies (0.38 gram) of polonium-210 to deliver 3.3 watts of electricity. The four-pound unit has an efficiency figure of 5.5% and can deliver about 10 kilowatt-hours over a period of 280 days.

Although this efficiency figure was considered fantastically high a short time ago, efficiencies of 18% are now reported possible within the present state of the art. Unless available money

MODEL OF the SNAP III device, the heart of which is a thermoelectric generator designed and built for the Atomic Energy Commission by the Minnesota Mining & Manufacturing Company.

is wisely used in development, however, it may be several years before a working application with this efficiency is realized. According to Dr. Clarence Zener of Westinghouse, figures as high as 35% may be attained in the foreseeable future. Only two years ago no one had exceeded 1%.

•**Materials development**—Although the doped lead-telluride thermocouple was developed many years ago and has proved itself capable of efficient application, a large percentage of BuShips research and development money is going into materials research. The number of possible binary (and ternary) semi-metal combinations is practically unlimited, and a program to investigate every combination could assume fantastic proportions. Present methods require about a week per sample to merely screen each material. Thorough evaluation, which must come later, will require many weeks for each sample.

Presently, money is allocated roughly on the following basis:

Materials, 50%; devices, 40%; generators and radiators, 7%; servo controls, 2%; and services, 1%.

The attention given thermoelectric materials is, of course, demanded by their importance. Other aspects of the problems must also be considered, however, in designing a workable system.

Since the possible compounds that might be explored are almost limitless, there is a pressing need for criteria to predict the more promising materials.

In evaluating a thermoelectric material, three properties are of particular concern: Seebeck coefficient, electrical resistivity, and thermal conductivity. The relative importance of these properties varies with the application.

Of the various parameters involved in materials evaluation, thermal conductivity gets the most attention since it is least susceptible to modification. For this reason it serves as a valid basis for screening in a materials survey. A major problem here, however, i that measurements of thermal conduc tivity are extremely difficult to make

The basic properties have been ex pressed in a relationship to provide "figure of merit" (Z) for use as yardstick in preliminary evaluation:

$$Z = \frac{S^2p}{K}$$

S = Seebeck coefficient
p = specific electrical conductivity
K = specific thermal conductivity

The figure of merit thus provides basis for relative comparisons of th materials under study. To the presen a figure slightly in excess of 2.5×10 per degree Centigrade is the best th has been obtained for a single materi in commercial quantities.

Some of the best representative m terial combinations developed to dat and their figures of merit, are bismutl telluride (2.8×10^{-3}), lead tellunc (1.8×10^{-3}), and germanium-telluric (1.1×10^{-3}). Near-future goals a for figures of 4×10^{-3}. It is general felt that figures of above 4 will b necessary for commercial application

•**Government-sponsored research**— Westinghouse is the largest contract to the Navy under the current prograr It currently holds contracts totaling excess of $2,000,000, mostly for m terials development. They have h and are continuing a company-su ported research program larger th that for the Government. Much Westinghouse's materials developme started from the work of Dr. Zen (of Zener-diode frame). It was the fi to obtain efficiencies of more than 4

Government-supported work f the Air Force and Army on generat and radiator systems is being carri on by General Electric's Engineeri Lab. A company-underwritten progra is in progress at the Knolls Aton Power Lab. Total GE contracts amou to more than $200,000.

Servomechanisms Inc. is doing cl sified materials research work whi grew out of previous company proje dealing with high-temperature el tronic components. At present, S Navy contracts total about $100,0

Naval Research Laboratory p vides service for the entire defense p gram, including a measurements fa ity just nearing completion. NRL a is involved in what is described as "minor" materials effort.

A study of thermoelectricity been in progress at Battelle Memo Institute for several years and has cluded a number of semi-conduc materials. Institute contracts are excess of $100,000.

At least 12 other contractors implementing the Department of fense program. Several small contra

ve recently been let. These are rela-
ely small, mostly around $100,000,
d concern materials development
ly.

The entire SNAP program is under
e Atomic Energy Commission and
ly a part relates to the thermoelectric
velopment. The only other project
blicized to date is the development
a "plasma thermocouple" which uses
sium gas as one of the metallic
ermo elements. This unit produced
3 volts for almost 12 hours before it
as shut down. Heat was provided by
riched radium.

The AEC provides substantial sup-
rt on fundamental work on material
d devices. They recently began oper-
ons at a new $2.2 million fission
oducts plant at Oak Ridge to sepa-
te isotopes from reactor fuel wastes.
ne of the important uses of these
covered isotopes will be as heat
urces for thermoelectric generators.
ne of the isotopes, cerium-144, is of
rticular interest for the SNAP proj-
t. Even strontium-90 is being used.

•**Industry-sponsored programs**—
mpany-supported work in thermo-
ctricity is about equal to the present
vernment program. It includes sev-
al major efforts as well as numerous
all projects.

One of the major research efforts in
aterials is carried on by Merck and
., which has a pilot plant operation
th a capability of about 50 kg of
muth telluride per month. Merck
s under development processes for
ge-scale production of lead telluride,
d selenide, alloys of these two com-
unds and ternary alloys of bismuth
luride. Fundamental research is be-
g done on new compositions to
hieve substantial improvement in the
ure of merit. They reportedly are
rking on an unspecified material
ich it is hoped may reach a figure of
erit of 4 or better.

As mentioned earlier, Minnesota
ining and Mfg. Co. has been active
thermoelectric material development
ce 1950. 3M's work covers a wide
nge of research from theoretical treat-
ent of thermoelectric phenomena to
e design of working, commercially
plicable generators.

Both RCA and Whirlpool are work-
g on Peltier refrigeration materials.
CA was the first to produce a full-size
ermoelectric refrigerator.

Other companies active in the field
clude Nortronics, Texas Instruments,
urtiss-Wright, Franklin Institute, Gen-
al Atomic and National Carbon.

•**Future research**—The future pro-
am includes five main areas of re-
arch. The first of these is materials
d includes high-temperature materi-
, liquids, and films.

The second deals with the behavior of materials under severe environments —radiation, thermal and mechanical shock, and chemical atmospheres.

The third area has to do with design and fabrication principles of hardware: contact problems, cascading, structures optimimization, heat transfer, encapsulation and loading.

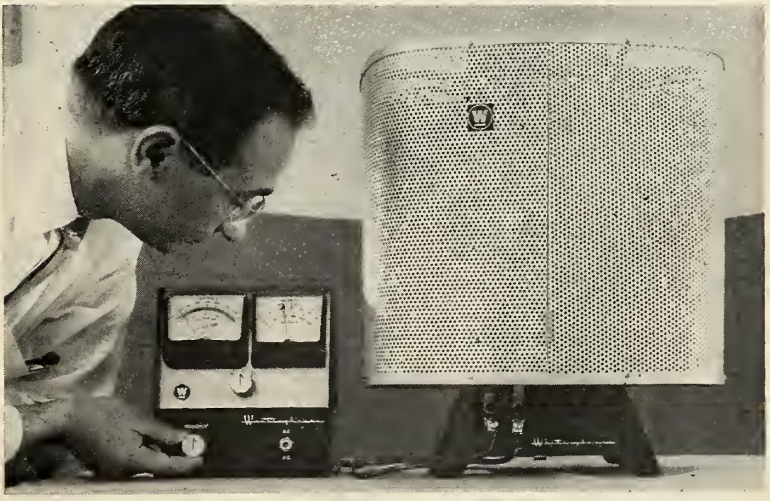
The fourth and fifth areas concern performance characteristics and physical-chemical phenomena.

Westinghouse has just completed a 100-watt generator for ARDC, called the TAP-100 (Terrestrial Auxiliary Power). This unit uses gas for fuel and is claimed to have an efficiency of about 8%. The thermoelectric material is a combination of semiconductors in cascade, also developed by Westinghouse. An advanced version being built will use a nuclear isotope source for heat.

Two contracts have recently been let for oil-fired 5 kw generators. The guaranteed efficiencies of these units, however, should be no more than 6.4%, a figure well below the present state of the art which would allow efficiencies up to about 18%. Requirements for 500kw generators are now in preparation.

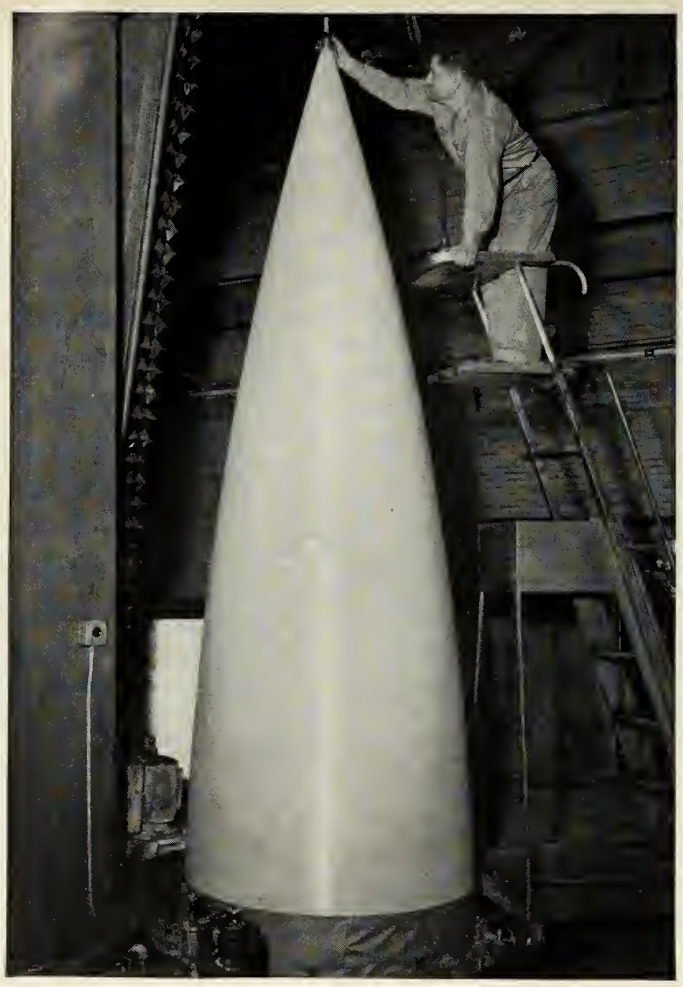
The Atomic Energy Commission is continuing with work on both isotope and reactor-heated generators.

Considering these facts, it seems logical to say that the potentialities of thermoelectric power generation (and refrigeration) are just beginning to be explored. The first giant steps have already been taken with practical versions of small generators and cooling units. Larger units can be foreseen in the near future.



With purposeful direction and adequate financing, the next year or two could certainly yield significant advancements to make possible early practical nuclear-powered thermoelectric generators for space vehicles and more mundane applications. Conceivably, a generator sufficient to power the plasma propulsion engine for interplanetary travel (M/R June 8) could be built within the next few years.

Thermoelectrics face severe competition, however, from several other exotic power sources which have come to the fore very recently. Solar cells are being continually improved and show promise for many space applications. Solar energy may, of course, be directly converted to electrical power through solar cells or used to furnish heat to a thermoelectric generator.



Electrostatic generation, although 300 years old, has been proposed as an efficient source for high-power applications in the vacuum and weightlessness of outer space.

Fuel cells which produce electricity directly from hydrogen and oxygen, such as the one recently announced by General Electric (M/R, June 8) are predicted to have a very bright future. Yale and Towne has announced plans for a cell within one or two years capable of powering a lift truck. A proposed sodium-mercury fuel cell would reportedly have fantastic potential.

It is impossible to say which of these possibilities, or even as-yet-unknown ones, will emerge as the most universal of tomorrow's power sources. It is fairly certain, though, that we may expect revolutionary progress in the near future. With the impetus of space program requirements and the broad interest of industry in the problem, the next few years may yield tremendous advancement.

TAP-100 built by Westinghouse is ten times larger than any similar thermoelectric device to date, and produces 100 watts.

NEW—the world's biggest filament-wound fiberglass radome!

Here it is — twelve feet high, four feet in diameter — the largest filament-wound fiberglass radome ever made. This huge form was produced by a special winding process—product of Kidde engineering knowledge and research — which results in an extremely high strength-to-weight ratio, plus a maximum in physical and electrical uniformity. Furthermore, this Kidde continuous-winding process, plastic reinforced by fiberglass, permits the construction of fiberglass shapes and forms which were either difficult or impossible to fabricate by previous methods.

Walter Kidde & Company has available complete facilities and personnel for the development, testing and production of fiberglass forms. If you have a problem in this area — write Kidde today. We've solved some pretty tough ones in the last thirty years!

FIBERGLASS FORMS ARE A KIDDE SPECIALTY!

Thanks to Kidde's continuou winding process, a new field fiberglass forms is now open aviation engineers. Structur tubing, pressure vessels can no be made stronger than steel wi half its weight!

For the engineer interested the field of pneumatics, filamer wound fiberglass spheres off the solution to many problem Available in capacities of fro 50 to 2500 cubic inches the spheres can withstand pre sures up to 5000 psi.

Missile rocket motor cases, t pedo bodies and missile radom are but a few of the forms wh Kidde can fabricate from hig strength, low-weight fibergla capable of withstanding te peratures as high as 1000°F. f short periods of time.

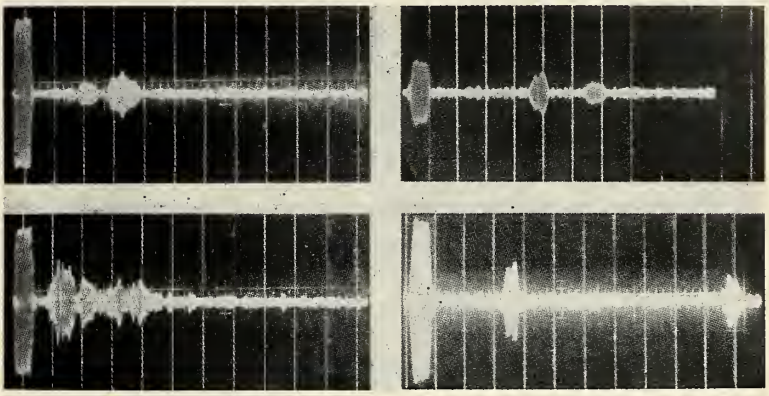
Successful AME Is Unveiled

Page Communications' gear tested in North Atlantic is expected to find more use on ionoscatter circuits and offers potential for increased channel capacity

by Charles D. LaFond

WASHINGTON—Three years in development, a new and highly successful anti-multipath equipment (AME) providing a significant increase in telecommunications reliability has been revealed here by Page Communications Engineers, Inc., a subsidiary of the Northrop Corporation.

The equipment essentially employs frequency translation technique at both the transmitting and receiving ends. Following long tests on northern operational ionospheric-scatter communication circuits of the U.S. Air Force, circuit outage resulting from ground-scatter multipath has been reduced from a recorded high of 27% to a maximum of 2½% of total operating time.



The North Atlantic Ionospheric-Scatter System in which AME has been employed is the first operational system built for the Air Force to use this propagational mode. A part of the global defense communication system, it stretches from Wachusett, Mass., to Goose Bay, Labrador; Sondrestrom and Thule, Greenland; Iceland, and England.

With a few changes in stations, the system has been in operation (including its initial test period) since 1954. Reliability has been very high and, based on this successful operation, many thousands of miles of additional dense scatter circuits have been or will be constructed. It is expected, that AME will be employed in the near future on other similar ionoscatter circuits.

• **History**—When the early VHF ionoscatter circuits were placed in operation, there existed a period of declining solar activity. Long-delay multipath as a result of ground scatter, propagated by the F-layer during daylight hours, was low. That multipath would increase with high solar activity was recognized, but its effect on reliability was underestimated. By November, 1955, solar activity had increased, the resulting sun-spot numbers had almost trebled, and multipath seriously affected operational performance.

It was at this time that the occurrence of long-delay multipath was observed on the North Atlantic ionoscatter circuits. Delays of the order of 50 milliseconds (msec) were encountered during daylight hours, severely impairing radio teleprinter operations and, at times, making operation impossible. To reduce this performance degradation, Page conceived a practical program for an experimental anti-multipath equipment and began its long development.

By the spring of 1957, prototype models built by Rixon Electronics, Inc., of Silver Spring, Md., were ready and installed in a few of the northern scatter stations. Tests were continued through the fall of 1957 and subsequently modified equipment (by then installed in five stations) provided substantial reduction in circuit outages due to ground-scatter multipath.

Frequently Observed — Rarely Observed

PHOTOGRAPHIC examples of ground-scatter multipath propagated by the F-Layer back-scatter multipath. To determine delays, a 6.6-millisecond pulse was transmitted with 10-millisecond timing markers.

A considerable amount of data was gathered during these preliminary tests. Delay data were obtained on these circuits while operating on a frequency of the order of 35 mc/s, with a transmitted pulse of approximately 6.7 msec. Ten msec markers were employed to determine the delays.

The ground-scatter multipath propagated by the F-layer was characterized by relatively long delays. Multiple echoes occurred in many instances—the majority arriving with delays in the range of from 10 to 50 msec. Occasional delays as long as 100 msec were observed. With the insertion of AME in the system, multipath interference was all but eliminated.

It was determined that an anti-multipath equipment providing protection for delays ranging from approximately 10 to 50 msec would be expected to give satisfactory performance.

• **Design criteria**—The character of multipath is such that to use frequency translation, the rate must be chosen so as to effect the first translation before

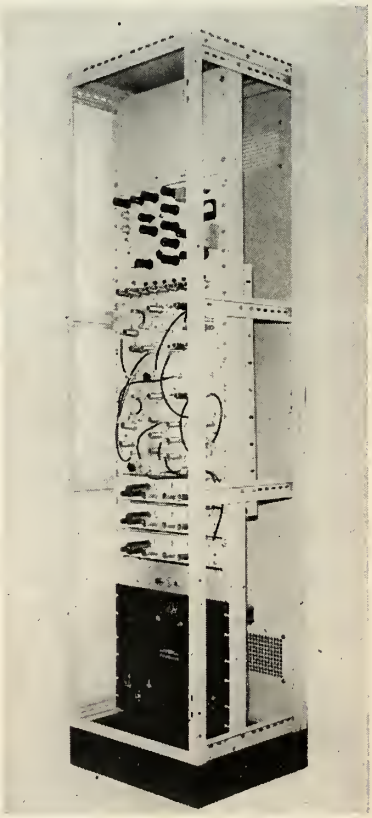
the arrival of shorter delay multipath. Also, the first translation frequency cannot be reused until the more serious multipath echoes have subsided.

This implies that for longer bit widths such as 5 to 10 msec, the translation had to occur once for every bit. For shorter bits the translation could be made to occur for any whole number of bits, as long as the sum of the widths does not exceed approximately 10 to 50 msec.

Multipath discrimination is a function of the magnitude of the frequency shift and skirt selectivity of the associated FSK (frequency shift) receiver. The receiver type in use on the systems under consideration, is a dual filter type and is known as the FSK-2. The skirt selectivity of the receiver is such that when using a frequency shift of 800 cps the discrimination against an echo arriving with a delay of 6.66 to 46.6 msec is from 12 to 60 db.

• **Description of AME**—AME as installed on the North Atlantic scatter system avoids receiving delayed multipath signals by means of a sequence of frequency translations. Immediately after the reception of each information bit, the transmitter and receiver are shifted synchronously from one frequency to the next. With the receiver lagging the transmitter by a time interval equal to the sum of the propagational and certain inherent equipment delays, the equipment operates in such a manner that the receiver and transmitter are not returned to any previously used frequency until approximately 46 msec have elapsed.

By this means, multipath signals arriving with delays longer than the time required for one frequency translation cycle, or arriving at a time less than the total time period required for one complete sequence of frequencies, will be off-frequency with respect to the receiver and will be attenuated in accordance with the receiver selectivity characteristics.



The equipment satisfactorily attenuates multipath components by shifting in 800-cps increments and employing seven different frequencies for mark and space. Beginning at the normal operating frequency, a shift of 800-cps is made, followed by successive shifts to 1600 and 2400 cps above the operating frequency. At this point a negative translation is made to 2400 cps below normal operating frequency, followed by successive shifts upward to 1600 and 800 cps below the normal operating frequency.

When used in a typical ionoscatter system, the transmitting AME is inserted between the output of the frequency multiplier and the input of the exciter combiner.

The signal input to the transmitting AME is the normal FSK-2 signal, while the output is translated over seven frequencies for mark and seven frequencies for space. Thus the output signal may appear on any of 14 frequencies, but only one frequency is transmitted at any one time.

The receiving AME is inserted between the output of the FSK-2 r-f amplifier and the input to the converter panel. The receiving translation is accomplished in a manner such that the signal applied to the converter now approximates the original FSK signal with the multipath echoes appearing off-frequency. The F-layer propagated multipath is attenuated by the selectivity of the mark-space filters of the FSK-2 receiver.

The rate at which the frequency translation occurs is determined by t timing of the multiplex equipme (When operating with the AN/FGC multiplex, the frequency translati occurs once for each transmitted and is coincident with the mark-spa transition.) Since the FSK-2 receiv normally is operated in dual space versity, it is necessary to provide AM with an additional set of mixers a an i-f amplifier.

PROTOTYPE model of Page's rack-mounted experimental Anti-Multipath Equipment Built by Rixon Electronics, Inc.

• **Cryptographic compatibility**—T experimental AME will operate w encrypting systems compatible with t multiplex equipment now in use on t scatter circuits. The equipment install in the North Atlantic area has be handling routine encrypted traffic w satisfactory performance. The equ ment also will handle synchronc cryptographic systems having a ma space output and a discrete modu tion rate not exceeding 600 bits/s and with a minimum mark-space tra ition rate of approximately 30 bits/s

• **Transmission security**—Page a has indicated that AME has a deg of inherent transmission security. Sir additional operations are performed modulation at the transmitting e these operations must be demodulat at the receiving end. For secure tra mission, the number of frequency st can be increased in the translation p gram in a random manner but w a known key.

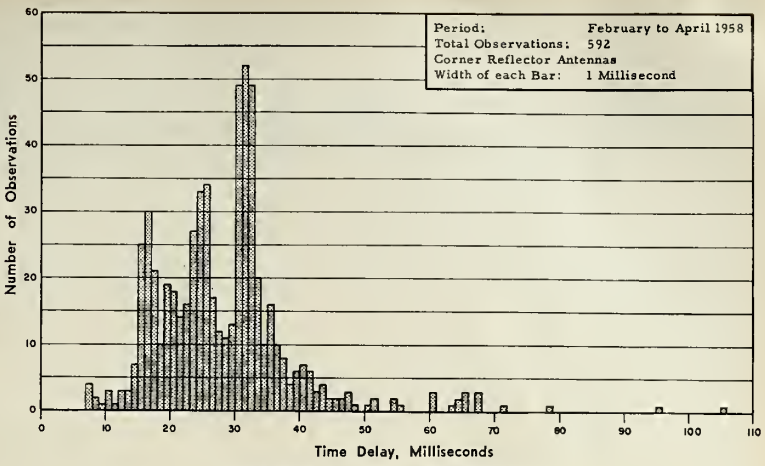
Attempts to jam such a syst would require an increased bandwi with the resulting increase in power the jamming transmitter. An impro ment in transmission security wo thus be obtained, but additional f quency spectra would be required.

• **Performance**—During Janua 1958, traffic averages on the north circuits due to ground-scatter multip ranged from about 15% to as high 27% of the total operating time w almost all averages occurring duri the daylight hours. During Febru and March 1958 operation, followi the installation of the experimen AME, circuit averages ranged fr 0.1% to a max of 2.5% of the to time. This improved performance a includes time for multipath recogniti and time to place the equipment operation. An appreciable portion this outage time was due to interf ence. (Improved FSK-2 channel filt and additional personnel are expec to produce a further reduction in o age time.) Loss in signal detectabi when using AME was measured found to be approximately 1db.

• **Meteoric and auroral multipath** The instrumentation required for measurement of ground-scatter mu path delays also permitted observat of meteoric multipath. A 400-μ pulse was transmitted and a total

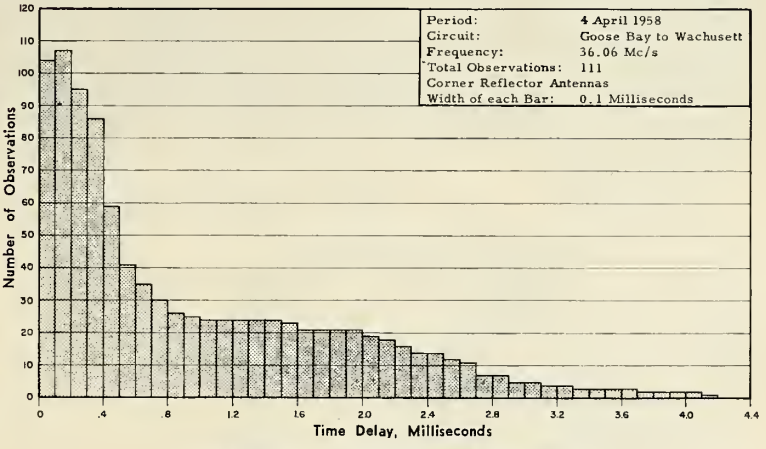
536 meteoric-multipath observations as made during April, 1958. The majority of meteoric multipath delays anged from 100 to 300 μsec with the elays occurring up to approximately 00 μsec.

During the above tests, a brief eriod of auroral disturbance was encountered, and limited data were obained. This type of multipath is characterized by an exponential decay over relatively long period. From the distribution of the observed auroral multipath, the predominent delays were less an approximately 1 msec, but continuous echoes ranging from possibly 0 msec to over 4 msec in length were served.



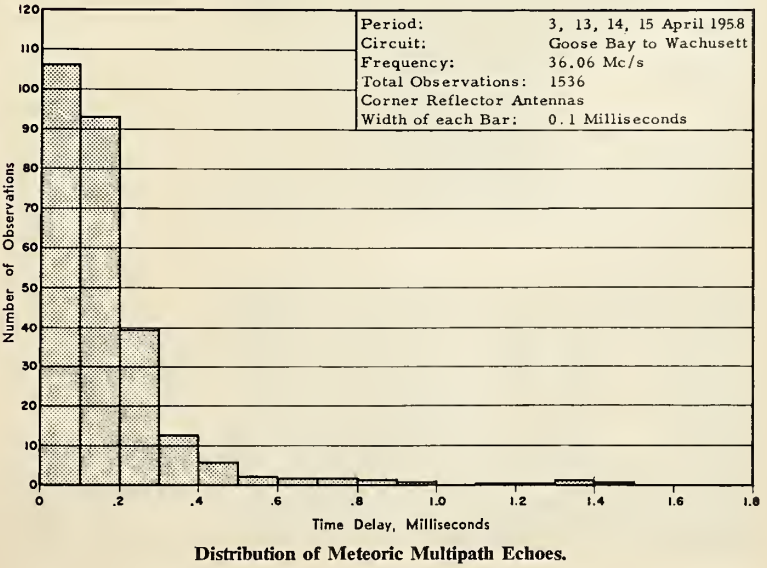
• **High-speed operation**—The constantly increasing volume of commercial and military traffic is requiring a ntinual increase in the number of affic channels. If additional teleprinter annels are to be provided by time-vision multiplex equipment, the bit gth becomes progressively smaller.

With newer 16-channel multiplex erating at 100 words per minute, the length is 1 msec. Such high-speed nsmission would be expected to result in a moderately high error liability ce to meteoric and auroral multipath. om the limited data obtained, it appars that satisfactory high-speed oeion of AME may be possible by pviding a minimum delay protection enal to the delay of a single bit and amaximum delay protection approxiting 5 msec.



Synchronous transmission at high speeds with low error rates on ionoseric scatter has been limited in the pt by problems of decision ambiguits, filtering, diversity combination, mtipath and timing errors. Experiments recently conducted using improved diversity and decision techniqs together with the AME appeared toovide at least partial solutions for alexcept the timing problem.

The development of AME together wi advances in diversity and decision teniques offers the potential for incsing channel capacity of present sc er circuits.



• **High frequency tests**—In June, 19, under contract with National Bau of Standards, Boulder, Colo., a tes program was initiated to deterine the effects of an experimental AE for reducing teleprinter errors fro multipath propagation on an exisi high-frequency radio circuit. AE was shown to provide an appreiae reduction in multipath errors. Tes results were similar to those obaind on ionoscatter circuits. A 2-10 ol reduction in errors were consisen observed, while the average reucon in error rate was approximately 1

Temco | AIRCRAFT DALLAS

NAVAL AVIATION MAKES HISTORY

NAVCAD Earland R. Clark of Stroudsburg, Pa., receiving congratulations from Rear Admiral Joseph M. Carson, Chief of Naval Air Basic Training.

with ALL-JET TRAINING

On March 13 at the Naval Air Basic Training Center, Saufley Field, Pensacola, Florida, the first student pilot in Naval Aviation history soloed a primary jet aircraft—without previous propeller-driven aircraft experience. The flight was made in a TT-1 "Pinto" — designed specifically by Temco for all-jet training.

The first primary jet trainer ever purchased by any of the U. S. military services, the Pinto is designed for today's jet age. It is built closely along the lines of high-performance jet fighter aircraft and gives the student pilot the "feel" of jet training from the very beginning.

With its high safety standards, fine handling characteristics, optimum maintenance provisions and overall reliability, the Pinto is an ideal primary jet trainer. From initial cost to operation and maintenance, it is designed to provide better pilots at less cost, in less time. All in all, it gives the Navy a decided edge in the ever-advancing pace of military jet aviation.

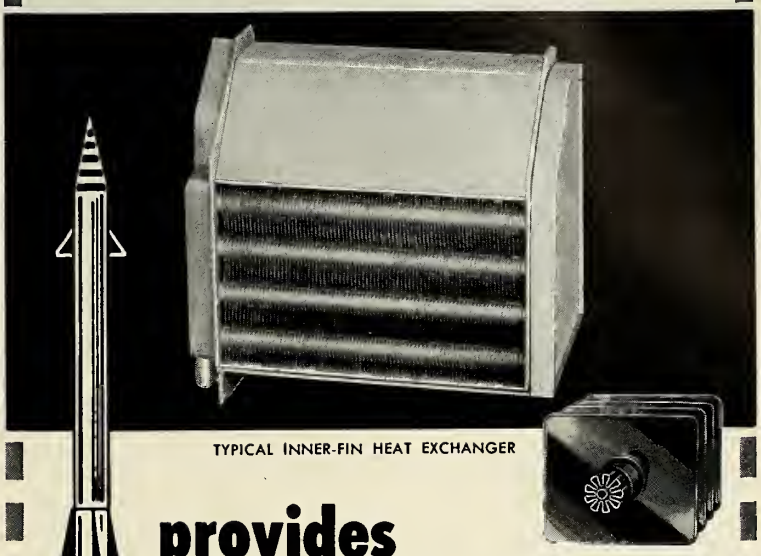
New 4000° Range for Pyrometers

WASHINGTON—Many of the questions arising in high-temperature standardization, calibration, use, and manufacture of optical pyrometers were discussed at the recent National Bureau of Standards symposium on high-temperature pyrometry. Principal subject at the meeting was the possible use of the temperature scale beyond 4000°K.

In the last few years, the interest in high-temperature measurements has created a demand for optical pyrometers capable of greater precision and accuracy. Recent studies, principally at the National Bureau of Standards and Argonne National Laboratory, the symposium sponsor, have shed new light on some of these problems.

Trends in the NBS work on optical pyrometry were outlined at the beginning of the conference by Dr. C. M. Herzfeld, chief of the bureau's Heat Division. He pointed out the necessity for improving methods of temperature measurement in the range 800°C to 3000°C under ideal conditions. Here, he said, accuracy, precision, and convenience of operation need further improvement.



An extension of methods for measuring temperatures under ideal or approximately ideal conditions in the range 4000°C to 10,000°C is also required. And improvements in temperature measurement under non-ideal conditions, such as in flames and complicated systems, are needed along with more basic research for new and better ways of measuring temperature.

• **Setting scale**—The procedure used at Argonne to establish the temperature scale in the range of 1000°C to 2000°C was discussed by R. J. Thorn and G. H. Winslow. The starting point was the freezing point of copper, which has been determined as 1083°C on the 1948 International Temperature Scale. Above the freezing point of copper a black body constructed of tungsten, contained in a vacuum and heated inductively, was employed as a light source.

The National Bureau of Standards and Argonne National Laboratory optical pyrometer temperature scales agree within 1°C at the gold point, but differ by 4°C above 1600°C. It was suggested that the most likely source of the difference lies in the effective wave lengths.

• **Limits**—Basic limitations on accuracy of optical pyrometry were discussed by D. R. Lovejoy of the National Research Council of Canada. An

INNER-FIN HEAT EXCHANGER

TYPICAL INNER-FIN HEAT EXCHANGER

provides cooling for missiles

Dunham-Bush Inner-Fin heat exchangers in Electronic Tube Cooling Units have proven the answer to the ever-present space problem in aero-electronic heat transfer.

Inner-fin coils have effected a 60% savings in coil sizes in units. Maintaining the same air and liquid pressure drops through the coil, an Inner-fin coil equivalent in capacity to a standard finned tube coil occupied 60% less space.

Whether your problem is "unusual" or not . . . whether it's in air conditioning, refrigeration or heating . . . Dunham-Bush has the products and engineers to meet your needs.

A HIGH POLISH FOR HIGH FLYING

KENNAMETAL* meets many critical requirements

This unretouched photograph shows the high reflective finish of a Librascope† integrator disc, 1⅜" diameter, made from Kennametal. Little discs like this one are of big importance in the operation of guidance systems, automatic pilots, and gyrostabilizers. In addition to a high polish, the discs must have high YME, hardness, and compressive strength . . . all qualities of Kennametal. Need for these properties, or a combination of other exceptional characteristics, is often met by a specific grade in the Kennametal family of tungsten carbide alloys.

In highly specialized types of photographic equipment, for example, Kennametal optical flats substitute for fragile glass mirrors to overcome distortion due to centrifugal or other forces. Many other vital parts subject to abrasion or corrosion are now being made of Kennametal . . . such parts as high pressure compressor cylinder liners, seal rings for rotary pumps, valve parts, plungers, and bushings.

JUST HOW IS KENNAMETAL SUPERIOR?

- Kennametal has an extremely high YME . . . up to 94 million psi compared to steel's 30 million . . . ranges up to 94.7 Rockwell A.
- Some grades of Kennametal have a density as high as 15.5 gms/cc . . . twice that of heat treated steel . . . while other grades will stand up for days in boiling 5% HNO_3 and 5% H_2SO_4.
- Kentanium,* a series of hard titanium carbide alloys, retains sufficient strength for many applications at temperatures of 2200°F. and above.

Chances are some vital components for *your* equipment could be made of Kennametal to provide greater reliability, over a wide range of operating conditions, than that provided by conventional materials. A Kennametal Carbide Engineer will gladly discuss your problem with you. Or write us for one or both of these booklets: B-111A—"Characteristics of Kennametal," and B-444A—"Kentanium." KENNAMETAL INC., Dept. MR, Latrobe, Pennsylvania. 97216

*Trademark †Trademark of Librascope, Inc.

INDUSTRY AND **KENNAMETAL**

. . . Partners in Progress

estimate of the errors arising in p mary standard pyrometer calibratio and in secondary standard strip lan calibrations agreed with the results a recent intercomparison of seconda strip lamps. An evaluation of a carb arc, accepted as a useful seconda standard at 3514°C, showed that this region the effect of the unce tainty in eeffctive wave length excee all other sources of error combined.

Even though very precise wo was involved in determining the pla num point at 1769°C, metal freezi points seem to offer little advanta over the strip lamp as secondary stan ards. It was determined that go commercial pyrometers can be ca brated with a precision comparable that of primary standard pyrometers the lamp current is calibrated direc rather than through the internal p tentiometer and scale.

R. D. Lee of the Bureau discuss the procedures used in calibrating op cal pyrometers and tungsten ribb filament lamps submitted to the B reau. Temperature comparisons a made with the NBS standard pyron ter from 800°C to 3800°C. In ca brating optical pyrometers, a tungst ribbon filament lamp is used as a te perature source up to a brightness te perature of about 2400°C, and a z conium arc and carbon arc to te peratures of 2800°C and 3800°C, spectively. Since the brightness te perature of a non-black body is det mined in part by the red filter glass a pyrometer, corrections are made test pyrometers with different tra mission characteristics.

The estimated uncertainty of calibration below 2800°C is based experience with a number of inst ments rather than on the specific d of a given instrument. The stand deviation, with respect to the Inter tional Temperature Scale, of pyrome and strip lamp calibrations is ab ±1° from 800°C to 1500°C, ±2° fr 1500°C to 2000°C and increases about ±6° at 2800°C.

• **Photoelectric**—A summary NBS work on photoelectric pyro ters was given by C. P. Johnson D. Erminy. The first model of the N photoelectric pyrometer has a se tivity of 0.1°C at the gold point a spectral band width of only 100 These features together with its jective character make it an attrac instrument. However, the measurem of brightness temperatures to a p cision of 0.1°C introduces many d cult problems involving lens abe tion, scattered light diffraction, and stability of light sources. These n be investigated in great detail before photoelectric pyrometer can be c sidered a reliable accurate instrum

McElroy Hit for Failure To Halt Missile Rivalry

A bitingly critical statement by the U.S. Chamber of Commerce accuses Defense Secretary McElroy of ignoring his power to stop "unhealthy and intolerable" service rivalry over missiles. The Chamber told the Senate Defense Appropriations Subcommittee Congress should force full and prompt use of McElroy's power "to curtail multiple development . . . and to eliminate unnecessary overlapping and duplication in a dozen or more support-type activities."

Without referring to specific cases, the Chamber urged the subcommittee to go along with House cuts in President Eisenhower's budget. Added the business group: "Congress has barely scratched the surface insofar as savings opportunities are concerned."

President Eisenhower has signed a bill increasing the authorization for an AEC "weapons diagnostic" plant at Los Alamos from $2.2 million to $3.5 million.

Nike-Hercules missiles have been integrated into the air defense system of U.S. military installations in West Germany.

Snark alert test at Northrop Field, Calif., was well past the half-way mark in a 400-hour continuous 24-hour standby operation last week. Total run will require 17 days.

Scientists Protest Secrecy; Harming Basic Research

Consensus of opinion of 17 Nobel prize-winning scientists is that secrecy in basic research is senseless and harmful, and in many cases causes unnecessary duplication of effort. The views were expressed in letters sent to the Senate Constitutional Rights Subcommittee in repsonse to queries from Chairman Thomas C. Hennings, Jr. (D-Mo.). Other points raised by the scientists—physicists, chemists and medical doctors—included:

—the government's "need to know" contract restrictions hinders scientific progress because it is often impossible to prove NTK until it is known "what the other man is doing";

—blanket security classifications often cover areas of a project which in no way touch on the sensitive;

—because many good scientists steer clear of classified projects under the present set-up, secrecy could become a cloak for mediocrity—morale is lowered when a scientist is denied the recognition that comes with publication of a discovery.

Hourglass Rocket Chamber

For NASA Solar Aircraft has developed brazed stainless steel rocket thrust chamber, shaped like hourglass. Chamber is cooled regeneratively and is being used to test new propellant combinations at Lewis Research Center, Cleveland. Chamber is formed of 120 U-shaped AM-350 channels .008 inches thick, assembled around a stainless steel mandrel with about 100,000 spot welds and wrapped tightly with .008 inch stainless steel ribbon, which is brazed with copper.

A prototype device to measure amount and temperature of gas in the upper atmosphere has been developed by **Lockheed Aircraft.** The unit, mounted in a satellite, contains a small hole which allows a beam of gas molecules to enter. This beam is chopped by whirling blades and hits a microphone where it produces a tone directly proportional to the density of the gas. In addition, the beam fans out, or spreads, a measurable amount proportional to the temperature of the entering gas. The same technique could, according to Lockheed, be used to provide an input to stabilize the satellite.

Renegotiate Act Extension Approved by Senate Unit

The Senate Finance Committee approved a 30-month extension of the current Renegotiation Act.

The committee's move had the effect of rejecting a House-passed four-year extension of the law. Critics attacked the House bill as a boon to big missile and aircraft manufacturers.

The Democratic Advisory Committee called for spending an extra $30 billion over the next four years to expand U.S. defenses.

The committee charged U.S. defenses are in disastrous shape compared to Russian military might.

It said one of the first steps needed to improve U.S. defenses is "a crash effort to bridge the missile gap." It called for doubling the production of **Martin** *Titans* and **Convair** *Atlases*.

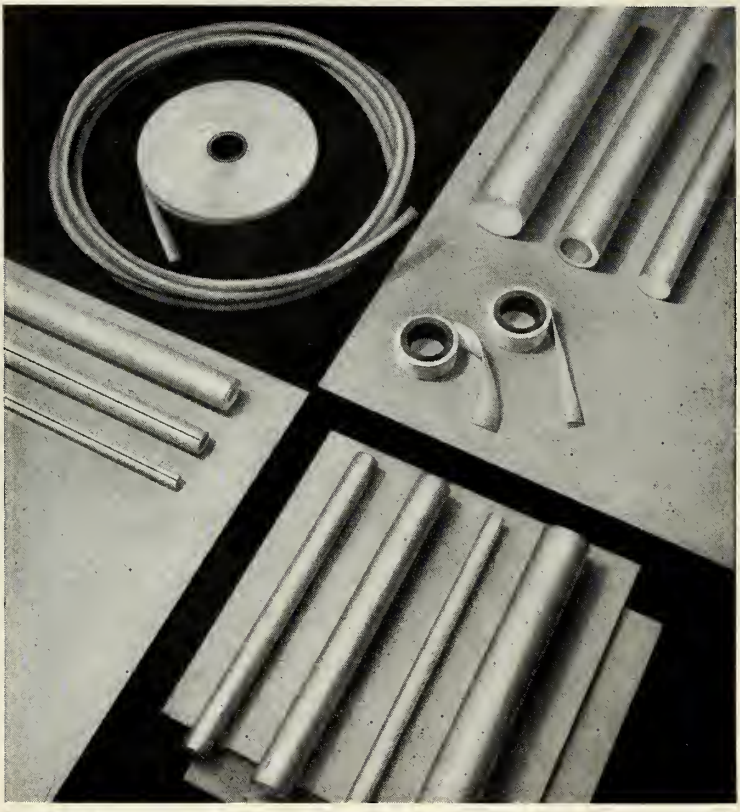
NASA established a committee to study the possibilities of establishing an equatorial launching site for satellites. Dr. John P. Hagen, NASA assistant director, is chairman. (M/R May 18)

French IRBM?

France is trying to develop its own IRBM. A special society called SEREB has been established to do the job in cooperation with French industry.

The Air Research & Development Command announced a twin-rail rocket sled reached a speed of 2,075 miles an hour last month in a test at Edwards AFB, Calif.

ARDC said it believed the speed was a record.



NASA awarded a contract to **Grumman Aircraft Engineering Corp.** to conduct studies for search and recovery operations for Project *Mercury*.

Consideration will be given to recovery by ships, helicopters, airplanes and airships.

March of Progress

Electronic Communications, Inc. has acquired Advanced Technology Corp. of Santa Barbara in exchange for 1,000 shares of ECI common stock. ATC which was formed by a group of research scientists formerly with Aerophysics Development Corp. and Avco will be operated as a wholly owned subsidiary of ECI . . . J. H. Pomeroy & Co., Inc., engineering and construction firm, has been cited for outstanding support of the Navy's ballistic missile program . . . Aerospace Industries Association (formerly Aircraft Industries Association) has raised the status of its Guided Missile Committee to Guided Missile Council—expanding its functions to include "all types of management interests relating to guided missile manufacture." . . . Aerojet-General Corp. has set up a Space Technology Division which will concentrate on research and development in electrical and other advanced propulsion and space systems. Facilities purchased by the company last month at Downey and Riverside, Calif., will be used to continue product development and to expand its powerplant and systems programs . . . Recent groundbreakings for new computer production facilities were begun by Philco in Montgomery County, Pa., and by Librascope, Inc., at Sonora, Calif. Philco's multi-million dollar plant, just west of Willow Grove, is scheduled for occupancy in November and will house production facilities for the Transac S-2000 electronic data processing system. Librascope, subsidiary of General Precision Equipment Corp. supplies weapon control systems and computers for anti-submarine warfare.

LOOK TO R/M TO MEET ALL YOUR TEFLON* NEEDS

R/M—headquarters for "Teflon" products. R/M can meet all your needs for sheets, rods, tubes, tape, thin-wall tubing (available with permanent color striping for identification purposes) and bondable "Teflon." R/M can also supply molded, machined and extruded "Teflon" made to your exact specifications.

"Teflon's" many remarkable properties have established it as an important material for use in aircraft, missiles and spacecraft. Yet when you select "Teflon" for a particular job, you solve only part of your problem. Equally important is the selection of a source of supply you can depend on for both competent engineering assistance and the production capability needed to meet your exact specifications and quantity requirements. This *complete* "Teflon" service is yours from R/M.

A pioneer in "Teflon" application and fabrication research, R/M offers design guidance that can help assure maximum part performance, and its ample production facilities can supply "Teflon" in the form best suited to your needs. Learn more about R/M's complete "Teflon" service—and how it can benefit you—by contacting your nearest R/M district office. Or write Plastic Products Division, Manheim, Pa.

by Dr. Albert Parry

The building of their first electron computers is reported by the scientis and engineers of Poland and Rumani Aid given by Soviet experts is praise The first Polish computer was made f that country's Hydro-Meteorological I stitute. The first Rumanian machin built under the leadership of the sta of the Timisoara (Temesvar) Polytec nic Institute, can make more tha 15,000 operations per second in add tion and subtraction.

Under the title "Materials of Sovi Rockets," a brief article in Prague monthly magazine *The SNTL Tec nical Digest* states that "the who world" is asking these questions: Wh are the most stressed parts of Sovi rockets made from? What materials a used in the fuel pump nozzles and con bustion chambers of the huge engin stressed by temperatures of many tho sand degrees and enormous force What materials are used for the k details of the 300,000 component par combined into one single interplaneta rocket? The Czechoslovak magazi then proceeds to give this answer:

"No material produced by metallu gical processes hitherto known prov to be satisfactory. In the USSR the pr duction of these materials has been d veloped on the basis of ultrasonics a plied during casting and solidificatio The crystallization of a freezing met begins with the formation of fir-tr shaped skeletons, the so-called dendrite

"The distribution of the solidifi metal around the dendrite axes dete mines the homogeneity of the structu and thus the quality of the final pro uct. In a melt exposed to vertical ultr sonic vibration and to a horizontal v bration with frequencies 10 tim higher, up to 200,000 c/s, the dendri axes are continuously breaking off, t solidified material acquires a super-fi ordered structure, and a material remarkable properties is obtained. T solution of the riddle is: while vibr tional casting is solved in the USSR the stage of shop operation, it is n yet solved in the USA."

• **Several movies** devoted to Sov advances in rocketry have recently be produced and issued by the Mosc Studio of Scientific Popular Film Among them is "Four-Legged Astr nauts" on the role of dogs in Russi rocket flights. A 20-minute docume tary, it includes material not alone the training of such canines as Lai of *Sputnik II* but also on Soviet expe ments with birds and rabbits which p ceded the work with dogs. This film

ased on a scenario by P. Isakov and rected by N. Tikohonov, with assistnce from A. Genin and A. Seriapin, o of Russia's space-medicine experts. nother latest Soviet film is "Automats Cosmos," dealing with automatic uipment installed on Russian rockets nt aloft for purposes of research.

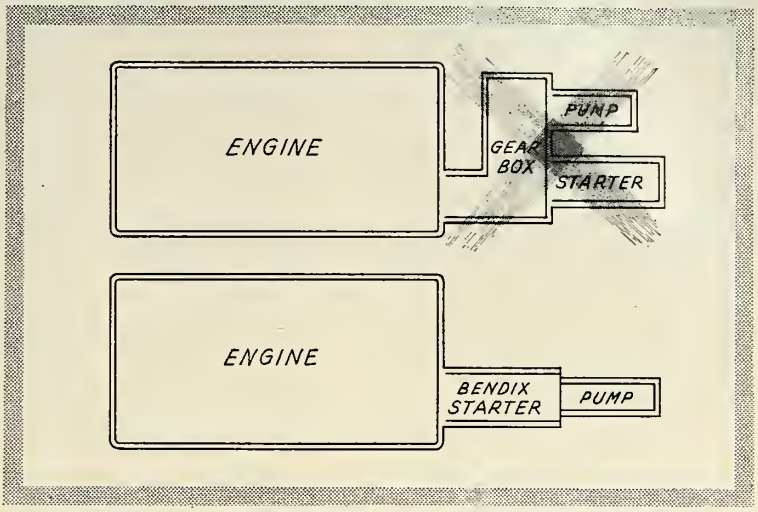
This film is notable for a detailed monstration of the equipment sent in *Sputnik III*. Yet another recent oscow film is "Mankind's Great Vicry," dedicated to the launching of the nar rocket *Mechta* or, as it is called tside the USSR, *Lunik*.

olaris Data Gathered y Leach Cylinder

COMPTON, CALIF.—A rugged inument cylinder has been developed the Leach Corp. for use in gathering launching data on the *Polaris*.

Mounted in the nose of a dummy ssile test-launched from submarines ship simulators, the 176-lb. cylinder rries 15 pounds of encapsulated inuments in a ½" steel shell. It can thstand complete submersion for two ys or more and resists water pressure 75 psi.

Instrumentation, claimed to have thstood more than 1000 g's in the ckage, includes a 14-channel recorder, battery power pack, three accelerometers, two rate gyros, transistrized amplifiers, control and calibran circuits, a static inverter providing 0-cycle power to the gyros, and a modulator package.



According to Leach engineers, en the *Polaris* dummy was test-fired to a bed of concrete the package rvived the shock with all instruents functioning perfectly, although missile itself was damaged.

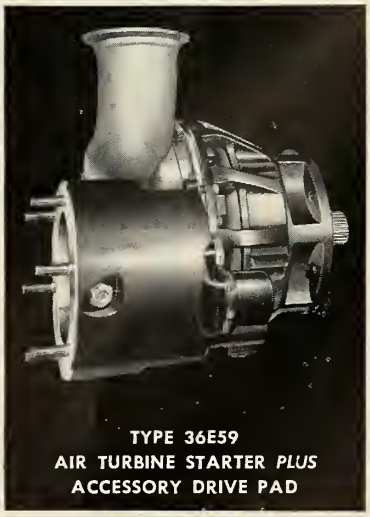
ilors Study *Polaris* b's Auto-navigator

DOWNEY, CALIF.—Selected U.S. vy men have begun a 12-week ining course in installation, checkc, maintenance and operation of the rtial auto-navigator being produced North American Aviation's Autonics Division for *Polaris*-equipped marines.

Training specialists of the division's litary Logistics and Service Departnt are instructing the Navy students a specially-designed laboratory conaing the first auto-navigator productn model—including gyro-stabilized tform, separate navigation console d digital computer.

BENDIX EXCLUSIVE FOR JET STARTERS: AN EXTRA ENGINE PAD!

NO GEAR BOX *is needed with the Bendix Utica air turbine starter with accessory drive pad. Compare standard engine arrangement, above, with Bendix Utica maunting, belaw.*



For the first time, Bendix Utica offers an air turbine starter and accessory drive unit, featuring an integral mounting pad for continuous drive of a pump, generator, compressor or similar accessory. Developed by Bendix engineers, the new unit minimizes accessory mounting problems, eliminates the need for a gear box and provides efficient operation with reduced weight and better economy. You get continuous accessory drive during engine operation—and the design can be readily modified to cover a wide range of engine requirements.

Engine starting with this unit is automatic and cockpit-actuated. The engine is carried through light-off by the starter to the established cut-out speed. Then air flow to the turbine is automatically cut off and the unit's starter section coasts to rest, while the engine continues to drive the mounted accessory through the drive shaft and accessory pad gearing.

The starter is adaptable to high-temperature cross-bleed starting for multi-engine installations. It conforms to military specifications and has a minimum service life of 600 starts and 500 operational hours between overhauls. Safe operation is assured by self-limiting runaway speed and reverse overload release mechanism. It's easy to install and mount and provides reliable operation at extreme ambient temperatures.

THE ROCKET HANDBOOK for AMATEURS

An Illustrated Guide to the Safe Construction, Testing, and Launching of Model Rockets

Edited by LT. COL. CHARLES M. PARKIN, Jr., Army Engineer Corps. *Foreword by WERNHER VON BRAUN.* Written by eleven contributors professionally engaged in rocket development, this book—the first of its kind—gives amateurs of all ages the basic knowledge essential for rocket-building. It includes chapters on organizing a rocket club, satellite orbit geometry, human factors in space flight, safety precautions, solid and liquid propellants, design, fuel pumps, cryogenics, test instruments and the building of a safe rocket. Thoroughly illustrated. The editor is President, National Capital Section, American Rocket Society. $5.95 at your bookstore or order from

missile business . . .

By DONALD E. PERRY

What's best when you want to pick up . . .
more defense business? Acquire a new company—and take a lot of bad features along with the good capabilities you want, or go after competent personnel and build from within your existing organization? There's a lot of merit in the latter approach, and one company that is going all-out for it is the Crosley Division of Avco Corp., which is attempting to up its military business from a present $80 million annually to $125 million.

Avco-Crosley has a good position in the areas . . .
it went into earlier: some 75 to 80% of the business in command receivers, good prospects in fuzing and arming—*Titan* work now and a new NOL contract for *Polaris*—and a healthy outlook for honeycomb structures both in aircraft and missiles.

An old-timer in *Falcon* structures . . .
and complete radar systems (both looking good), Avco-Crosley under President F. C. Reith months ago started broadening. "We determined," Reith said, "to get competent technical and professional people in new areas which we had not been in before." Targets: sonar, electronic checkout equipment, human engineering, infrared (surveillance, ICBM detection, mapping).

But how to approach it . . .
was another thing. Reith decided almost entirely on going out and getting the personnel. "Not that we have anything against acquisition; we haven't. We're still looking in the infrared field but we are being selective," he says.

Crosley's personnel build-up is reflected . . .
by nearly a 30% increase in its professional staff, giving the company what Reith considers a strong capability for new business. In key spots are many newcomers brought in from other concerns usually for one reason: a broad background in particular areas where Crosley wants to expand its business scope.

To cite just a few . . .
Dr. E. A. Steinhoff (formerly with Aerophysics Development Corp.), and former member of von Braun's Peenemunde team, heads up a new missiles department. He is considered one of the world's foremost authorities on missile system guidance and control. Marine Electronics has Dr. H. W. Marsh (formerly with Westinghouse in missile ground-handling equipment), who has a broad background in the quantitative nature of environment and signal processing for sonar systems.

Still another former Westinghouse specialist in electronic and electromechanical systems R&D—Dr. F. E. Lowance—serves as Crosley's vice president of engineering. Dr. John W. Odle, director of Crosley's Advanced Development Department, came from the University of Michigan with a varied background in mathematics and systems and analytical studies.

Brought in from Control Instrument Co. where he was Controller and director of Purchasing was R. B. Marston, Crosley's engineering controller.

Dr. Frank B. Brown, Crosley's Reliability Director, came from Melpar, where he directed a study program for integration of SAGE into Air Traffic Control. Coming from Martin's *Titan* program was J. C. Elms, now Crosley Electronics Engineering vice-president, directing Crosley's weapon systems R&D.

So you can take your choice . . .
Buy up companies and perhaps get too much deadwood, or be selective and pick your own. Avco-Crosley thinks it has the best approach.

letters

Thiokol Plans Clarified

To the Editor:

We are afraid that the West Coast Industry column in the May 18 issue of Missiles and Rockets may create considerable misunderstanding among our customers regarding our intentions toward systems contracting.

Thiokol Chemical Corporation has no intention of becoming a prime systems contractor based upon the fact that our customers are such contractors and it is believed that they would not look favorably on purchasing engines from a competitor.

The history of engine development and production activities in this country has demonstrated the validity of separating such activities from airframe development and production. We believe that the validity of this principle applies equally to the aircraft and air-breathing engine field and the field of rocket engine development and production for missiles. The cost of the development and production of a rocket power plant is normally a small portion of the cost of a missile system. No single missile system should have to support the cost of a strong technological team engaged in engine development.

We believe that the current tendency to combine a wide range of technologies into a single organization can only serve to weaken the technological strength of many of the groups engaged in sub-system development. The current tendency to integrate rocket development technology with prime systems capability could have a very debilitating effect upon the whole industry.

It will remain the policy of Thiokol Chemical Corporation to serve as an engine development and production contractor. We hope to be able to serve many prime systems contractors in such a role. We have no intention whatsoever of scaring off our customers by going into competition with them.

H. W. Ritchey
Vice-President
Thiokol Chemical Corp.
Huntsville, Ala.

Trolley Breakdown?

To the Editor:

Regarding the "Moon Trolley" letter in the June 8 issue of M/R.

The two fellows from Picatinny Arsenal could have saved themselves a lot of embarrassment by a few simple calculations.

The strongest materials today would be torn by their own weigbt if made into a cylindrical cable only 20 miles in length. Even at an altitude of 4000 miles, the longest cable that could be hung would be 80 miles; at 12,000 miles: 320 miles long. A *tapered* cable could be made approximately 1000 miles long at the 12,000-mile altitude. However, the 1000-mile cable would be of little value toward spanning the 239,000 miles to tbe moon.

Sorry fellows, but the "moon trolley" must be given up as well as that strong brand of coffee you have been drinking.

R. S. Ronay
Aero. Engineer

Our Pleasure

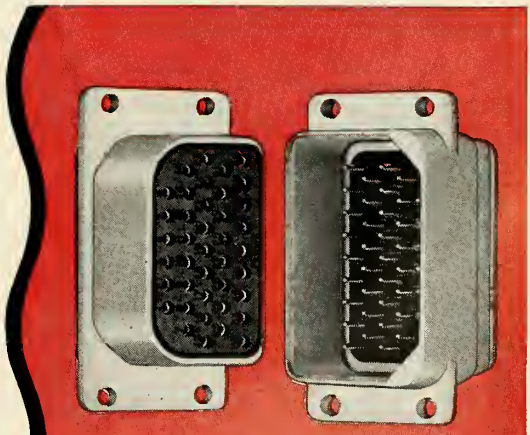
To the Editor:

The U.S. Army Ordnance Guided Missile School Library wishes to thank the Editors of Missiles and Rockets for tbeir most gracious gift of the bound sets of Missiles and Rockets, volumes 1-4, presented 7 May 1959.

These volumes are an invaluable reference addition to our new library. They form a nucleus for researcb in tbe field of guided missiles and are much appreciated and used by staff, faculty, and students of the school.

H. M. Thomas, Jr.
Major, Ord Corps.
US Army
Ordnance Guided Missile School
Redstone Arsenal, Ala.

BENDIX SR RACK AND PANEL CONNECTOR



with outstanding resistance to vibration

The Bendix type SR rack and panel electrical connector provides exceptional resistance to vibration. The low engagement force gives it a decided advantage over existing connectors of this type.

Adding to the efficiency of this rack and panel connector is the performance-proven Bendix "clip-type" closed entry socket. Insert patterns are available to mate with existing equipment in the field.

Available in general duty, pressurized or potted types, each with temperature range of −67°F to +257°F.

Here, indeed, is another outstanding Bendix product that should be your first choice in rack and panel connectors.

FEATURES:

Resilient Insert • Solid Shell Construction • Low Engagement Forces • Closed Entry Sockets • Positive Contact Alignment Contacts—heavily gold plated Cadmium Plate—clear irridite finish • Easily Pressurized to latest MIL Specifications.

STRENGTH OF CERAMICS AT HIGH TEMPERATURES, U.S. Department of Commerce, National Bureau of Standards, Summary Technical Report.

The strength of aluminum oxide single crystals has recently been studied at the National Bureau of Standards as a function of temperature. Modulus-of-rupture measurements were related to factors affecting crystal strength at temperatures up to 1000°C.

Certain crystal orientation significantly affects crystal strength by giving rise to plastic deformation at stress concentrations. As these stresses are relieved, crystal strength increases.

AN ANALYSIS OF ELECTRON BEAM INTERACTION WITH EMPHASIS ON THE CROSSED FIELD PROBLEM, J. W. Kluver, University of California for WADC, USAF, 86 pp., $2.25, available from OTS, U.S. Department of Commerce, Washington 25, D.C.

A general method of approach for the approximate solution of the small-signal perturbation of a bounded electron stream surrounded by a periodic structure was developed. With the requirement that energy be conserved, the electron stream is described on the basis of the Maxwell-Boltzmann equations.

The perturbation of dynamic equations is carried out and its effect on a defined boundary of the electron stream discussed. Beginning with the Lorentz reciprocity theorem in its complex form, the approximate boundary conditions for the rf electric field at an equivalent surface of the periodic structure are derived.

Characteristic waves are found by employing the discontinuity conditions at the beam boundary. A power theorem describing the conversion of rf kinetic energy into electromagnetic energy is also given.

GROWTH OF METAL SINGLE CRYSTALS, U.S. Department of Commerce, National Bureau of Standards, Summary Technical Report.

Equipment has been developed to grow preferentially oriented metal monocrystals in practically any cross-sectional shape. These crystals, having an ordered atomic arrangement, are particularly useful in studying the influence of crystal structure on corrosion.

A pre-selected crystallographic orientation is obtained with a technique known as "seeding," and the desired cross-sectional shape is produced by growing the crystals in a vertical furnace.

MECHANICAL DEGRADATION OF POLYMERS, U.S. Department of Commerce, National Bureau of Standards, Summary Technical Report.

To obtain basic information on mechanical degradation of polymers, the
tional Bureau of Standards has bee
vestigating the effect of mechanical sl
ing on various concentrated polyr
solutions. By studying mechanical deg
tion, the use of polymers which deg
excessively under severe conditions
be avoided and special polymers w
will remain intact under such condi
can be developed.

**SURVEY OF THE FIELD OF MECHAN
TRANSLATION OF LANGUAGES,** G
Reitwiesner and M. H. Weik, Ballistic
search Laboratories, U.S. Army, 65 pp.,
available from OTS, U.S. Department of
merce.

Developments and problems in
field of mechanical translation of
guages by means of high-speed elect
computers are analyzed in this Arm
port.

The information, gleaned from a
ature survey and from interviews
workers in the field, covers the mecha
translation activities of government,
mercial, and educational institution
the United States as well as contribu
made in Britain and Russia. Includ
a bibliography of 175 references.

The subject is described in tern
the two major aspects of machine t
lation, methodology and equipment.
methodology, the problems of
matical rules, syntactical analysis,
tionaries, flow charts, and program
are discussed. Information on equip
deals with character sensing equip
information storage devices, pri
methods, and arithmetic or proce
organs.

A number of general purpose
tronic computing systems are disc
along with the special purpose comp
of the University of Washington an
Air Force's Mechanical Translator
1. Predictions are made concerning f
developments and the time necessar
fore working programs in the ma
translation field can be expected.

**EXPERIMENTAL ALTITUDE PERFORMA
OF JP-4 FUEL AND LIQUID-OXY
ROCKET ENGINE WITH AN AREA R
OF 48,** Anthony Fortini, Charles D. He
and Vearl N. Huff, May, 1959, 27 pp. (
MEMORANDUM 5-14-59E).

The performance of a rocket e
having a nozzle area ratio of 48 wa
perimentally measured at four alti
and corrected to vacuum condition
comparison of experimental perfor
with that of a sea-level engine havir
area ratio of 5.5 was made.

The propellant combination JP-4
and liquid oxygen was used for boti
gines. The chamber pressure was cor
at 600 lb./sq. in. abs. Altitudes wer
tained by an ejector system utilizin
rocket exhaust gas as the pumping

Results indicate the large-area
engine gives a specific impulse of
lb.-sec./lb. at vacuum conditions. A
level, the large-area-ratio engine
countered flow separation within
nozzle and the specific impulse wa
lb.-sec./lb. The results also include
ured heat-transfer rates and heat loa
the engine.

This is not and is under no circumstances to be construed as an offer to sell, or as an offer to buy, or as a solicitation of an offer to buy, any of the securities herein mentioned. The offering is made only by the Prospectus.

propulsion engineering

Basic studies on plastics . . .
at Brooklyn Polytechnic Institute will give propulsion engineers more data on solid propellants. Brooklyn Poly will study cracking in rigid plastic materials under a $28,325 Wright Air Development Center contract. Far from being "library research" on a theoretical level, the project is primarily concerned with cracking under actual environmental stresses. Although the materials to be studied first are not fuels or binders, the information they yield will be applicable to polysulphide rubber and polyurethane. Brooklyn poly researchers will first look at nylon, polystyrene and irradiated polyethylene.

Propellant grains may change radically . . .
if the study yields new information about cracking, and many chemists and engineers expect it will come up with new findings, since very little has been done along this line. Grain sizes, configurations, storage requirements and applications are controlled by cracking characteristics of plastic material fuels and binders.

You can learn solid state chemistry . . .
or at least the rudiments of the solid state chemistry you have to have in your work, in a quick, easy way—thanks to a new Department of Commerce ten-year study of Navy activity in the field. Commerce's Office of Technical Services reviews 75 Office of Naval Research Reports in solid-state work in "Solid State Chemistry: Final Report on the Activity During the Period of This Contract 1948-1957," Technical Report No. 76, $1.00. W. A. Weyl and E. C. Marboe break down a discussion of the properties of matter into five easy-to-follow subheadings, and then cover six classical areas.

The ortho-para hydrogen conversion . . .
which has been discussed in this column several times as a factor moving liquid hydrogen closer to practical consideration as a missile fuel, is used as a brief example of quantum mechanics in the study. Weyl and Marboe discuss the K. Fajans concept of chemical binding forces at length: "Quantum mechanics deviates from the classical approaches to chemistry by not using atoms or ions as the ultimate building units, but by referring to the interaction of nuclei and electrons . . ."

For missilemen the major points . . .
outlined in the report are:

(1) Building unit properties change with their environment; concept of a "constant chemical bond" can be misleading.

(2) Any disturbance of a crystal lattice creates a "depth action" on the chemical binding forces.

(3) The first principle is establishment of electro-neutrality in the smallest volume possible; the second is the need of screening of positive cores, which accounts for most elements being solids at room temperatures.

(4) The rate of many chemical reactions is determined by penetration of a proton into a polarizable anion; anion polarizability varies with thermal vibrations of surrounding ions.

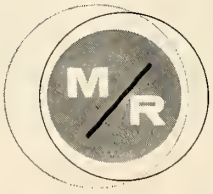
Properties of oxide surfaces . . .
is one study covered by the final report. Others in the list of 76 papers which contribute to the review include:

Catalytic activity of gases on decomposition of hydrogen peroxide; decomposition of hydrogen peroxide by lead fluoride; catalytic activity of semiconductors; effect of foreign atoms on electronic properties of crystals; change of a P-type semiconductor into a N-type semiconductor by vapor treatment; mechanism of recrystallization and sintering; differential thermal analysis of metal hydroxides; application of the polarization theory to ceramic problems; kinetics of reactions between oxides in the solid state; structure of the high-temperature modification of lithium sulphate.

Reach the heart of the missile market throughout the entire year.

missiles and rockets

3rd ANNUAL engineering progress issue



featuring the Guided Missile Encyclopedia

JULY 20, 1959

Your guarantee to high readership and constant reference . . . in the $7 billion missile market.

Here is the most exciting and popular issue of the year. Authoritative articles by recognized experts — from Astrometry to Ion Propulsion — PLUS the new and expanded Guided Missile Encyclopedia. Now you can reach the market in depth and quality as never before. Write, call or wire your *missile and rockets* representative today, and find out how you can put your sales message where it will reach the heart of the missile market throughout the entire year.

missiles and rockets

AN AMERICAN AVIATION PUBLICATION

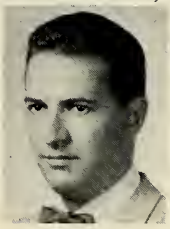
1001 VERMONT AVENUE, N. W., WASHINGTON 5, D. C.

RUBEL

John H. Rubel, 39, on leave from the Hughes Aircraft Co., where he was director of airborne systems laboratories, has been named assistant director for strategic weapons in the DOD office of research and engineering headed by Dr. Herbert F. York.

An electrical engineering graduate of California Institute Technology, Rubel has 16 years' experience in the electronics industry. In 46, he joined the Hughes company, ere he contributed to work on autotic celestial navigation, the *Falcon* ies of air-to-air guided missiles and airborne armament control systems d in Air Force all-weather jet intertors.

Dr. F. Kenneth Brasted, president of University of Dallas since 1955, has ed Texas Instruments Inc. as adistrative director of the Central Rerch Laboratory. Dr. Brasted holds a helor of arts degree from the Univerof Florida, an M.A. degree from umbia University, and a Ph.D. from w York University. Before coming to llas, he served seven years as a memof the coordinating committee and ector of the educational department, tional Association of Manufacturers.



Space Technology Laboratories, Inc., appointed **Walter B. Brewer** manager its airborne systems and test depart-nt, *Atlas* Program Office. Brewer had n associate manager of the airborne ems and test department since joining in March of this year.

A new hypersonic tunnel department Cornell Aeronautical Laboratory, Buf-, will be headed by **King D. Bird,** nerly head of the transonic tunnel de-ment. **James F. Martin** has been ed assistant head of the new depart-t.

John P. Andes has been named head the transonic tunnel department and **W. Cotter,** assistant department head. es was formerly assistant department d of transonic tunnel.

PITTINGER

Rocket Power, Inc., a subsidiary of the Gabriel Co., has named **A. Lincoln Pittinger** vice president for planning and marketing. Pittinger, closely linked with the rocket and missile industry since 1943, was commander of the first Navy rocket plant at China Lake. As civilian of product and production engineerat NOTS through 1951, he helped place into production the Navy 2.75-inch *Mighty Mouse* aircraft rocket and many other advanced weapons. Called to Europe in 1952 by the NATO countries, he set up rocket facilities in Belgium and Greece to support the free world arsenal. Pittinger also has served as director of R&D for the Cooper Development Corp., and was responsible for major advances in upper-atmosphere sounding rockets. He resumed private practice in late 1957, and had been very active in the development of high-altitude meteorological sounding rockets prior to joining Rocket Power, Inc.

ELDER

Rocket Power, Inc., also has appointed **John K. Elder** vice president of its applied research and testing laboratories. Following graduation from the California Institute of Technology, Elder was employed by the Aerojet-General Corp. where he engaged in solid propellant research and development activities for four years. He joined Grand Central Rocket in 1955.

William H. Clark is the new general superintendent of Allen B. Du Mont Laboratories, Inc. Clark will be responsible for the company's plant and office facilities in Clifton, Passaic, and East Paterson, N.J. He succeeds **Walter H. Husselrath,** who died on May 25.

SHERWIN

At the Norden Division, United Aircraft Corp., **Samuel B. Sherwin** has been appointed manager of the Ketay department in Commack, L.I., and **Wladimir Reichel** engineering manager. A native New Yorker, Sherwin has been manager of the overhaul and repair department of UA's Hamilton Standard Division at Windsor Locks, Conn. Reichel is Norden's basic design chief and a pioneer in instrument miniaturization. Born in St. Petersburg, Russia, he has been in the United States since 1923 and holds numerous patents on servo components, gyro and navigational instruments. He directed important work on inertial navigational system development.

Dr. Robert W. Perry has been named head of Republic Aviation's re-entry simulation laboratory in the company's new $14 million Astronautical Center. **Dr. Samuel Korman** will head the Materials Development Laboratory to create new alloys and synthetics capable of withstanding the rigors of outer space. Associated with Dr. Korman are **Dr. Robert P. Bastian** and **Dr. Stanley Zirinsky,** who have been appointed chief chemist and chief metallurgist, respectively. Perry was formerly manager of the research branch, gas dynamics facility, at the Arnold Engineering Development Center, and is a member of NASA's Advisory Committee on Fluid Dynamics. Korman was formerly a consultant to the Atomic Energy Commission, the Air Force and several American industrial firms. Before joining Republic, Bastian was associated with Sylvania Electric Products, where he was an engineering specialist in analytical and inorganic chemistry, and Zirinsky was previously staff consultant to the Missiles and Space Vehicles Division of the General Electric Co.

Woodman Perine, president of Vitro Engineering Co., has been named vice president of Vitro Corp. of America. **James C. Tourek,** chief project manager, was named acting general manager of Vitro Engineering, replacing Perine. In his new position, Perine will direct the activities of Vitro's Technical Services and Products Group which includes Vitro Engineering; the Refinery Engineering Co., Tulsa, Okla.; Nems-Clarke Co., Silver Spring, Md.; Thieblot Aircraft Company, Martinsburg, W.Va., and Vitro Laboratories, Silver Spring, Md.

Dr. A. W. Wortham, manager of the Quality Assurance Department, Semiconductor-Components division of Texas Instruments Incorporated, has been elected executive director of the American Society for Quality Control. Dr. Wortham has jurisdiction over District 14 of the ASQC, including Texas, Oklahoma, New Mexico, Louisiana and Mexico.

Shareholders of Lear, Inc. recently elected six new directors and re-elected eight to the board. The new directors are: **James L. Anast,** who became president on April 9, 1959; **Roy J. Benecchi,** group vice president; **Barney M. Giles,** assistant to the president; **Philip E. Golde,** senior vice president, secretary and general counsel; **K. Robert Hahn,** executive vice president, and **Andrew F. Haiduck,** group vice president.

Re-elected were **William P. Lear,** chairman of the board, and **Richard M. Mock,** chairman of the executive committee; and the following non-employee directors: **Harold R. Boyer** of General Motors Corp., **A. G. Handschumacher** of Rheem Manufacturing Co., **Kenneth MacGrath** of High Standard Manufacturing Corp., **Richard W. Millar** of William R. Staats & Co., **Clarence J. Reese** of Continental Motors Corp. and **Russell A. Stevenson,** University of Michigan.

Jay W. Schnackel has been appointed vice president of Remington Rand Division of Sperry Rand Corp. in an overall staff position in the company's Univac-Tabulating Division. Schnackel has been vice president for manufacturing services of International Business Machines Corp. since 1956.

contract awards

ARPA

$600,000—**RCA**, for studying the feasibility of tracking and intercepting enemy space satellites.

MISCELLANEOUS

$193,000—**Avion Div. of ACF Industries, Inc.**, Paramus, N.J., for production of radar beacons used in test firings to extend the precision of tracking range of ground radar. (Contract awarded by the United Kingdom Treasury and Supply Delegation in the U.S.)

NASA

Grumman Aircraft Engineering Corp., has been awarded a contract to conduct studies concerning the search and recovery operations of Project *Mercury*. (Amount not disclosed.)

$100,000—**Applied Science Corp. of Princeton**, for airborne statistical telemetering equipment for Project *Mercury*. (Subcontract from **McDonnell Aircraft Corp.**).

NAVY

Stavid Engineering, Inc., Plainfield, N.J., for initiation of a new, advanced, lightweight shipboard radar, designated AN/SPS-40. (Amount not disclosed.)

$3,750,000—**Collins Radio Co.**, Cedar Rapids, Iowa, for production of electronic counter-measures receivers to be installed on both surface and undersea craft.

$140,050—**Cooper Development Corp.**, Monrovia, Calif., for development and fabrication of flight instrumentation assemblies.

$128,000—**Ralph T. Viola**, Oxnard, Calif., for site preparation for Cotar acquisition system at Point Mugu, Calif.

$100,000—**Magnetic Research Corp.**, Hawthorne, Calif., for production of 28 volt, 60 cps ground power supplies for use on the *Talos* missile.

$92,000—**Les Kelley**, Belmont, Calif., for instrumentation site, Point Pillar, Princeton, Calif., for naval missile center, Point Mugu, Calif.

$87,000—**NRC Equipment Corp.**, Newton Highlands, Mass., for design, development and production of ultra-high-vacuum gauges for satellite instrumentation.

$49,929—**Raymond Engineering Laboratory, Inc.**, Middletown, Conn., for design, manufacture and evaluation of rocketborne ionosphere antennas, housing units and antenna opening mechanisms.

$34,800—**General Dynamics Corp., Liquid Carbonic Div.**, Los Angeles, for liquid bulk oxygen.

$32,688—**Broderick & Bascom Rope Co.**, St. Louis, for wire rope, 6x19, preformed, high-strength, uncoated for aircraft launching and arresting.

$26,390—**Century Tool Co.**, Palmyra, N.Y., for organizational maintenance and assembly tool kit for the *Nike*.

AIR FORCE

Hermes Electronics Co., Cambridge, Mass., has been awarded a contract of more than $1,000,000 dollars for timing equipment for the IBM Bombing-Navigation Missile Guidance System to be used in the B-70 (subcontract from **International Business Machines Corp.**).

Westinghouse Electric Corp., Air Arm Div., Baltimore, has been awarded a "multi-million" dollar contract for development and building of a defensive system for the B-70 (subcontract from **North American Aviation**).

$47,000,000—**Sperry Gyroscope Co.**, Great Neck, N.Y., for development and production of high-powered air search radar systems.

$3,900,000—**Ryan Aeronautical Co.**, for *Firebee* jet targets to be used to simulate "enemy" attacks at Tyndall AFB, Fla.

$3,600,000—**Lear, Inc., Instrument Div.**, Grand Rapids, Mich., for coordinate converter systems for the early version of the Boeing *Bomarc IM-99*. (Total program now exceeds $20,000,000.)

$2,712,132—**Convair Div. of General Dynamics Corp.**, for B-58 mobile training units.

$2,300,000—**International Telephone & Telegraph Corp.**, San Fernando, for 36 multiple voltage supply systems for the B-58 (subcontract from **Convair Div. of General Dynamics**).

$1,843,944—**General Precision Laboratory, Inc.**, for navigation equipment components.

$1,706,469—**Convair Div. of General Dynamics Corp.**, San Diego, for installation of new Azusa Mark II missile tracking equipment at Cape Canaveral.

$1,500,000—**Electronic Associates, Inc.**, Long Branch, N.J., for range instrumentation equipment for the Eglin Gulf Test Range (subcontract from **IT&T**).

$951,374—**Convair Astronautics Div. of General Dynamics Corp.**, San Diego, for design, development and fabrication of a cosine rate system for the Azusa Mk II and other related items.

$819,400—**Diversified Builders**, Cocoa, Fla., for construction of a blockhouse for the *Saturn* missile at Cape Canaveral.

$194,692—**Conoga Div. of Underwood Corp.**, Ft. Walton Beach, Fla., for seven airborne timing systems to be used in telemetry aircraft of the AFMTC's 6550th Operations Squadron.

$182,500—**Raytheon Mfg. Co., Missile Systems Div.**, Waltham, Mass., for 13 Rayspan spectum analyzers.

$153,000—**Model Engineering & Mfg., Inc.**, Huntington, Ind., for signal generators to support various aircraft and missiles.

$100,000—**Ratigan Electronics, Inc.**, Glendale, Calif., for components to be used in the *Falcon* (subcontract from **Hughes Aircraft Co., Tucson Div.**).

$86,971—**Graflex, Inc.**, Rochester, N.Y. for 231 speed graphic camera sets.

$54,717—**Motorola, Inc.**, Phoenix, Ariz., for sub-miniature frequency modulated UHF radio receiver set used to receive and decode range safety command signals during missile flight operations.

$43,930—**Cooper Development Corp.**, Monrovia, Calif., for *Aspan* rocket vehicles, less *Nike* booster and *Nike* fins, engineering field service and firing circuit test set.

$37,955—**University of Illinois**, for laboratory investigation of SAGE operator performance factors contributing to operator fatigue.

$36,000—**Minneapolis-Honeywell Regulator Co., Aeronautical Div.**, Minneapolis, for liquid oxygen amplifiers for various aircraft.

$35,000—**Consolidated Avionics Corp.**, Westbury, N.Y., for a strain gage data reduction system (subcontract from **Hamilton Standard Div., United Aircraft Corp.**).

ARMY

BJ Electronics, Borg-Warner Corp., Santa Ana, Calif., for GMD-1 transportable ground tracking and data recording equipment (substantial addition to a $500,000 initial contract).

$3,172,929—**Douglas Aircraft Co. Inc.**, Santa Monica, for launching area items.

$2,798,219—**Blount Brothers Construction Co.**, Montgomery, Ala., for construction of *Bomarc* facilities.

$2,390,567—**Jet Propulsion Laboratory**, Calif. Institute of Technology, for continued research and development of the *Sergeant*.

$981,000—**Sperry Utah Engineering Laboratory**, Salt Lake City, for *Sergeant* missile repair parts.

$900,000—**The Firestone Tire & Rubber Co.**, Los Angeles, for the *Corporal* missile.

$390,000—**Rheem Manufacturing Co.**, Downey, Calif., for research and development.

$363,961—**Westwood Construction Co.**, Denver, for construction of liquid oxygen facility at F. E. Warren AFB, Cheyenne, Wyo.

$260,483—**Gilfillan Brothers, Inc.**, Los Angeles, for engineering services.

$150,879—**Douglas Aircraft Co., Inc.**, Santa Monica, for *Honest John* program.

$140,000—**The Rust Engineering Co.**, Pittsburgh, Pa., for architect-engineer services in connection with design of Third Increment Missilemaster facilities.

$122,599—**Murray Construction Co.**, Battle Creek, Mich., for building rehabilitation for SAGE support facility at Fort Custer AFB.

$100,000—**Paul Monroe Co.**, Bell Gard
Calif., for construction of specialized
draulic equipment for actuating the d
of "half-hard" *Atlas* sites at Fairc
AFB.

$85,000—**Pennsylvania State University,**
versity Park, Pa., for research and
velopment on the determination of
tron densities of the ionosphere.

$84,240—**Motordyne, Inc.**, Monrovia, C
for motor generators.

$75,000—**Ryan Aeronautical Co.**, San D
for miscellaneous support items.

$70,000—**California Institute of Technol**
Pasadena, for research and developm

$68,577—**Gilfillan Brothers, Inc.**, Los A
les, for *Corporal* missile repair parts.

$64,481—**The Andy Electric Company**
Andalusia, Ala., for the installatio
500 KW engine generators at Cape
Blas, Fla.

$60,000—**University of Florida, Gaines**
for basic research.

$57,527—**Aircraft Armaments Inc., Coc**
ville, Md., for design, fabrication and
livery of a rocket sled.

$56,279—**Telemetering Corp. of Ame**
Sepulveda, for technical services.

$54,161—**Nortronics Div., Northrop C**
Anaheim, Calif., for research and dev
ment.

$50,359—**Douglas Aircraft Co., Charl**
N.C. for *Nike* spare parts and compon

$49,850—**Spectralab Instruments, Monr**
Calif., for telemetry systems.

$39,800—**Servomechanisms, Inc., Hawth**
Calif., for computer systems.

$35,000—**North American Aviation, Ro**
dyne Div., for design and developme

$34,042—**Interstate Electronics Corp.,**
heim, Calif., for supplies.

$34,000—**Murice H. Connel & Associates,**
Miami, Fla., for architect-engine
services for design of *Saturn* missile
ice structure at Patrick AFB, Fla.

$31,911—**Motorola, Inc.**, Phoenix, for te
try sets.

$30,800—**Thiokol Chemical Corp., El**
Md., for motor, recruit and solid pr
lants.

$25,686—**Ryan Aeronautical Co.**, San I
for target missile flight service pro

$16,636—**Western Electric Co., Inc.,**
York, for *Nike* spare parts and co
nents.

BIDS

The following bids were made publ

Ogden Air Materiel Area, Hill AFB,

ENGINEERS • SCIENTISTS

General Electric's Heavy Military Electronics Dept.

AWARDED CONTRACT FOR

Systems Integration, Engineering, and Management of...

AIR WEAPONS CONTROL SYSTEM 212L

A universal electronic control system to meet the vast problem of Air Defense outside of the Continental United States

Systems-oriented engineers and scientists will appreciate the broadband technical challenge of the Air Weapons Control System 212L. There are important openings for men who are experienced in: Weapons Systems Analysis • Mathematical Analysis of Engineering Problems • Computer Programming • Military Communication Systems • Radar Systems • Weapons Control Systems • Electronic Circuitry • Industrial & Military Psychology.

● Working in close cooperation with the USAF, it is Heavy Military's responsibility to integrate all subsystems—data acquisition, communications, data processing and display—plus various defensive weapons into a well coordinated and efficient operating system.

VERSATILE AIR CONTROL APPLICATIONS The revolutionary 212L can be used to defend a single airfield, or, by linking control sites together, it could be used in a limited action to provide air control for an area the size of Alaska. Similarly, by linking the capabilities of countries together, a system could be provided for the air control of an entire continent. Designed for *both* fixed and mobile applications, the 212L will be used primarily outside the U. S. since the SAGE system is used for the defense of this country.

HMED IS ALSO DESIGNING THE "HEART" OF THE SYSTEM In addition to its prime mission of providing systems management, HMED will design, develop and produce the data processing and display subsystem which is the "heart" of the 212L. Capable of rapidly and automatically detecting and tracking air targets, the subsystem operates without human assistance, except under unusual circumstances.

OTHER FAR-RANGING PROGRAMS AT HEAVY MILITARY

At the present time additional far-ranging programs are being pursued in diverse and important areas at HMED:

- Fixed & Mobile Radar
- Shipborne Radar
- Underwater Detection Systems
- Missile Guidance
- Data Handling Systems
- Communications

Individuals with experience in systems analysis or specific equipment design in the areas listed above are invited to forward their resume in complete confidence to Mr. George Callender, Div. 73-WY.

HEAVY MILITARY ELECTRONICS DEPARTMENT

GENERAL ELECTRIC

Court Street Syracuse, N. Y.

—when and where—

JUNE

American Institute of Electrical Engineers, Air Transportation Conference, Olympic Hotel, Seattle, June 24-26.

Nuclear Industry Division, Instrument Society of America, Second National Symposium, Idaho Falls, Idaho, June 24-26.

Institute of Radio Engineers' Professional Group on Military Electronics, Third National Convention on Military Electronics, Sheraton Park Hotel, Washington, D.C., June 29-July 1.

Pennsylvania State University, Summer Seminar on Plastics—Its Mechanical Properties, Design and Applications, University Park, Pa., June 29-July 3.

JULY

Tenth Annual Basic Statistical Quality Institute, University of Connecticut, Storrs, July 12-24.

Radio Technical Commission for Aeronautics and Los Angeles Section of the Institute of Radio Engineers, Third Biennial Joint Meeting, Ambassador Hotel, Los Angeles, July 16-17.

Scond Annual Institute on Missile Technology, Chief of Research and Development, U.S. Army, University of Connecticut, Storrs, July 26-Aug. 7.

The Denver Research Institute of the University of Denver, 6th Annual Symposium on Computers and Data Processing, Stanley Hotel, Estes Park, Colo., July 30-31.

AUGUST

Institution of Investigation of Biological Sciences, sponsored by Air Force Office of Scientific Research—Aeromedical Div., World Health Organization and United Nations Educational Scientific and Cultural Organization, Montevideo, Uruguay, Aug. 2-7.

William Frederick Durand Centennial Conference, Problems of Hypersonic and Space Flight, Stanford University, Stanford, Calif., Aug. 5-7.

Institute of Radio Engineers' Professional Group on Ultrasonics Engineering, First National Ultrasonics Symposium, Stanford University, Stanford, Calif., Aug. 17.

Institute of Radio Engineers, Western Electronic Show & Convention, Cow Palace, San Francisco, Aug. 18-21.

American Rocket Society, Gas Dynamics Symposium, Northwestern University, Evanston, Ill., Aug. 24-26.

International Astronautical Federation, 10th Annual Congress, Church House, Westminster, London, Aug. 31-Sept. 5.

SEPTEMBER

Air Force Office of Scientific Research and General Electric Company's Missile and Space Vehicle Department, Conference on Physical Chemistry in Aerodynamics and Space Flight, University of Pennsylvania, Philadelphia, Sept. 1-2.

Air Force Association and Panorama; send reservations to AFA Housing Bureau, P. O. Box 1511, Miami Beach, Sept. 3-6.

Standards Engineering Society, Boston Section, Eighth Annual Meeting, Hotel Somerset, Boston, Sept. 21-22.

Instrument Society of America, Conference and Exhibit, Chicago, Sept. 21-25.

Industrial Nuclear Technology Conference, sponsored by Armour Research Foundation of Illinois Institute of Technology, Nucleonics Magazine and Atomic Energy Commission, Morrison Hotel, Chicago, Sept. 22-24.

American Rocket Society, Solid Propellants Conference, Princeton University, Princeton, N.J., Sept. 24-25.

Institute of Radio Engineers, 1959 National Symposium on Telemetering, Civil Auditorium, San Francisco, Sept. 28-30.

OCTOBER

Electronics Industries Association Conference, University of Pennsylvania, University Park, Oct. 6-7.

NO FINER CAPABILITIES

NO FINER CAPACITIES

To assure the missile industry of dependable high-energy solid propellants and solid rocket motors, Grand Central Rocket recently added $2,500,000 in improved engineering, research, manufacturing, and testing facilities. With these improvements and our competent technical staff we offer the finest capabilities.

Grand Central Rocket has in operation the largest solid propellant mixer in America. This mixer has a batch capacity of 350 gallons. In addition, a 50-gallon mixer and 25-gallon mixer are also operating. The maximum capacity of these three ultra modern, remote controlled mixers exceeds 500,000 pounds of solid propellant per month. Immediate plans call for replacing the 25-gallon mixer with a 200-gallon mixer.

These capabilities and capacities are *your* assurance of rapid and satisfactory service.

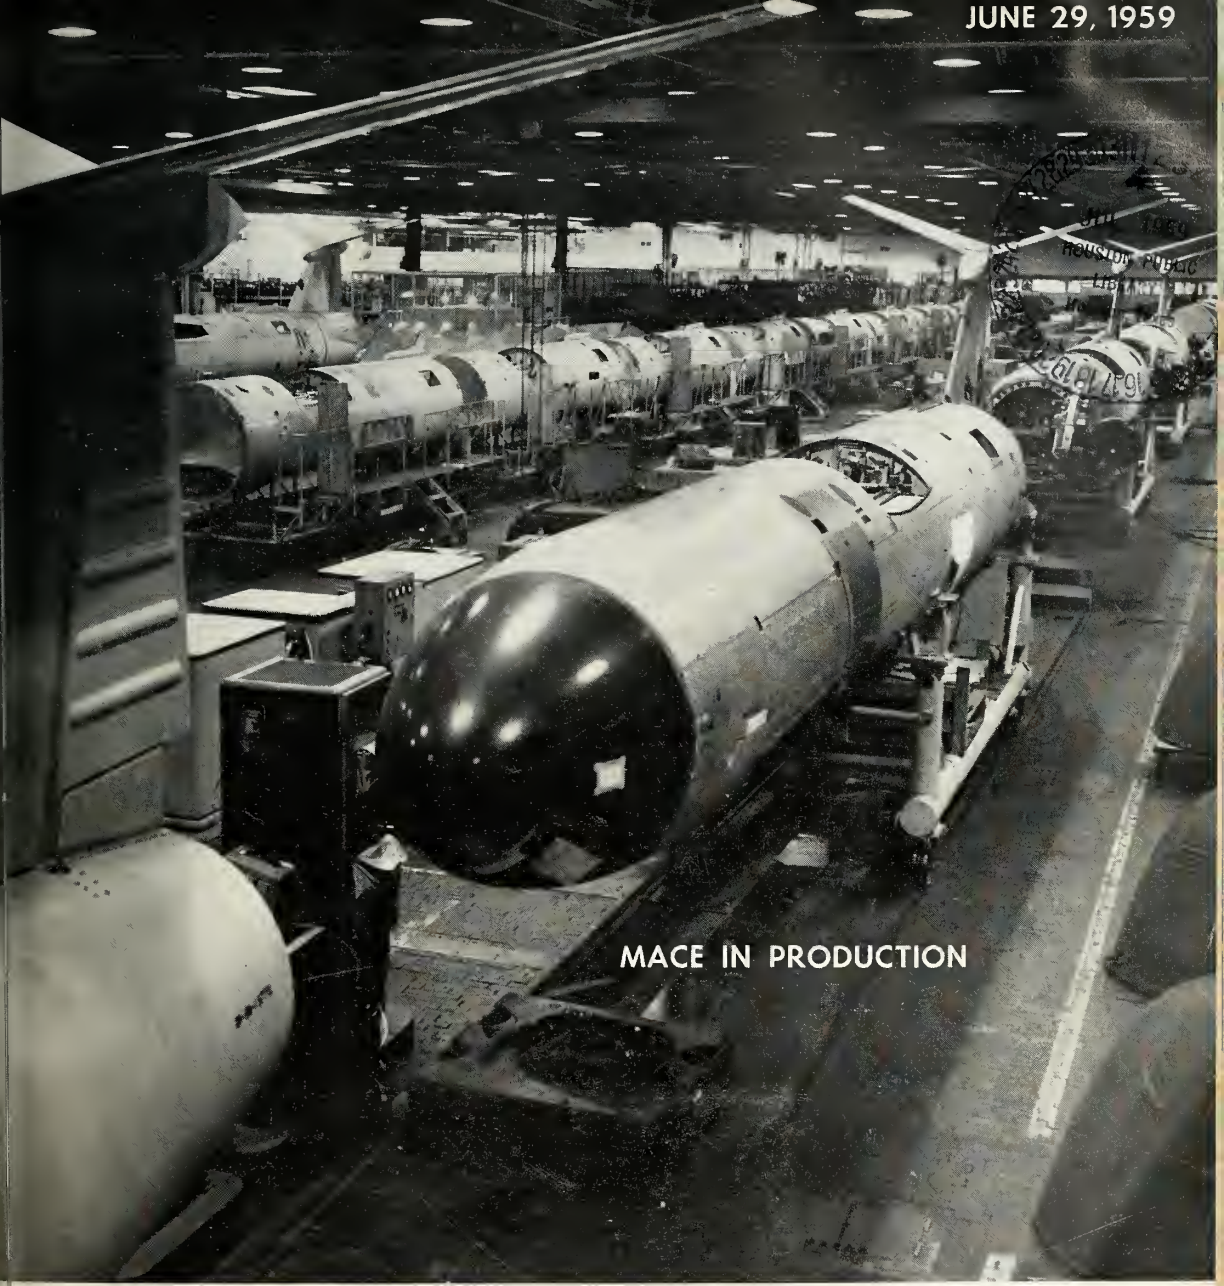
Sharp new eye for navigation

SHARPEST new "eye" for flight is the Ryan C-W Doppler navigator. Based on the advanced development of continuous-wave radar, this system of electronics "intelligence" has been pioneered by Ryan and the U.S. Navy for navigation at all speeds. It tells pilots how to fly to any spot on the globe, with speed and precision, and lets them know exactly where they are at all times.

With the Ryan navigator, military aircraft and jetliners can fly a new "electronic skyway" which provides precise separation between planes and conserves time and fuel. And, because RYANAV systems work right down to ground and sea levels, these advantages accrue at take-off, climb-out, descent and landings, as well as enroute.

The Navy has selected RYANAV for installation in six major types of naval aircraft. They are already in squadron use in the Navy's first all-weather anti-submarine helicopters and are being installed in Army aircraft and helicopters, for low-level "nap of the earth" operations.

Reasons for such wide and versatile use are found in the unique features of RYANAV systems: They are the lightest, simplest, most reliable, most compact of their type. They are setting new standards of accuracy, freedom from adjustment, and ease of maintenance... opening new areas of navigational, guidance, and orientation applications. Ryan electronics engineering assistance is available upon request, to those who wish to explore these areas.



Ryan's rapid growth in electronics is creating new opportunities for engineers and technicians

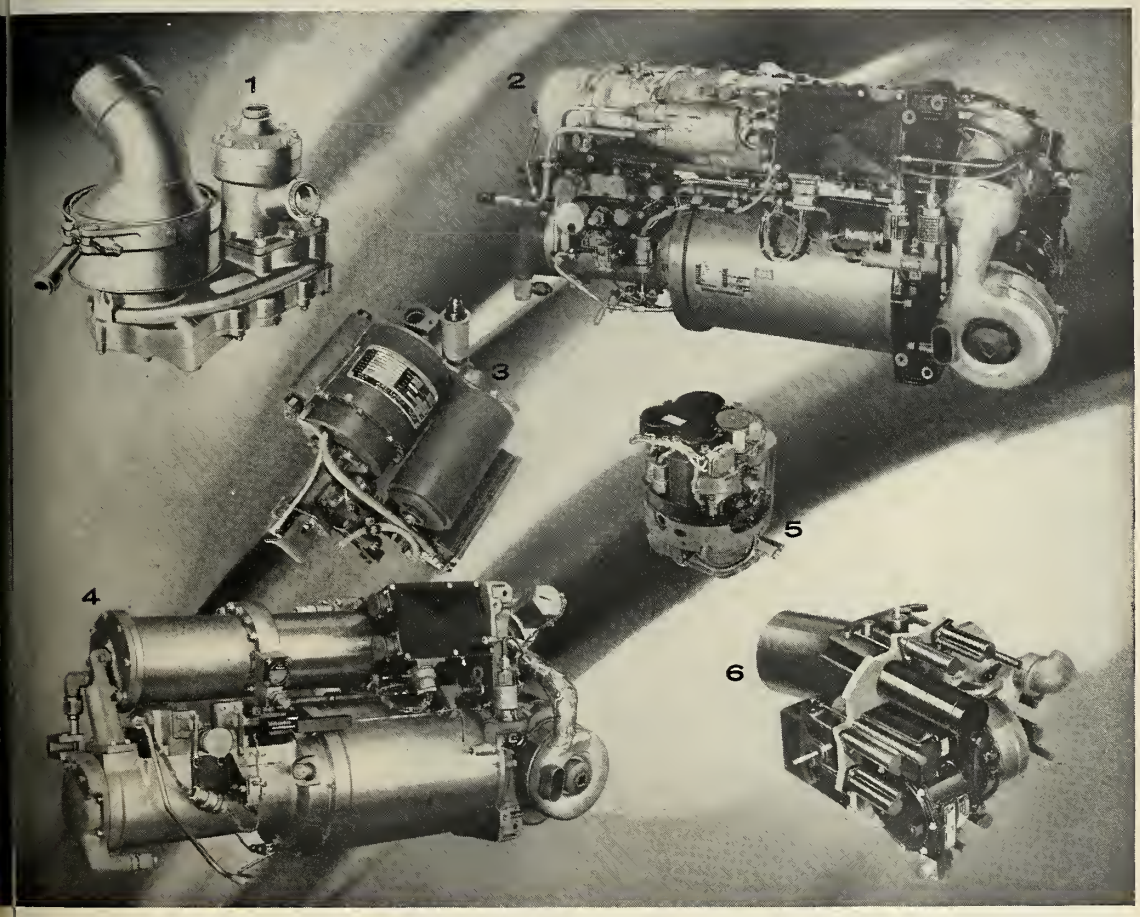
ADVANCED FUEL MANAGEMENT ...FROM SMI

The requirements of accurately tanking missiles with propellants is but one of the areas of fuel management in which Servomechanisms, Inc. has demonstrated capability. *Propellant utilization* and *thrust control* are other areas in which SMI has developed highly accurate and precise measuring and control systems.

SMI's LOX Tanking Computer, which has been in production for the past year, accurately measures, controls and indicates the level of liquid oxygen in missile tanks. Loading is accomplished rapidly and accurately due to a unique two-mode control system. The first mode permits extremely high pumping rates until about 98% capacity is reached. The second mode then takes over and controls a precise proportioning valve which adds the necessary LOX to fill the tank within 0.1% accuracy. The second mode also provides continuous topping, thus compensating for LOX evaporation losses during standby.

SMI has currently in development, more advanced fuel management systems to meet the increasingly complex requirements of the next generation of missiles and spacecraft.

SMI would welcome the opportunity to discuss and propose solutions to your fuel management problems. Write for descriptive literature.



Positions are available for qualified engineers and scientists in the areas of:
Systems Synthesis and Analysis—Project Management —Qualification and Environmental Test Engineering—High Vacuum Deposition Techniques.

DELIVERED—thousands of missile APUs

1. *Solid propellant—hydraulic output* 2. *Liquid propellant—hydraulic and electric output* 3. *Solid propellant—electric and mechanical drive output* 4. *Liquid propellant—hydraulic and electric output* 5. *Solid propellant—hydraulic and electric output* 6. *Solid propellant—hydraulic, electric and steering outputs*

AiResearch has designed, developed, manufactured and delivered thousands of missile accessory power units. Extremely reliable and lightweight, these various solid and liquid monopropellant APUs are completely self-sustaining within the missile system. Designed to minimum space and weight requirements, they are built to withstand high G loading and severe temperature extremes.

The several units pictured above provide hydraulic, electrical and/or steering surface control depending on the customer's requirement. Delivered horsepower ranges from 1.2 to 35 h.p. over hot gas operating durations from 30 seconds to 20 minutes. Electrical regulation is maintained as closely as ±½%. A significant advance in missile APUs is unit #6 pictured above. This package represents the first integrated hydraulic and electrical power unit providing a steering surface actuation system.

These tailored systems utilize the extensive hardware experience and complete laboratory, test and production facilities of AiResearch needed for quick and efficient quantity production of complex APU systems. AiResearch is the world's largest and most experienced manufacturer of lightweight turbomachinery—the key component of its APU systems. Your inquiries are invited.

The Matter of the Munitions Lobby

Last week we mentioned on this page that the President had used the allusion "munitions lobby" in a press conference reference which might be taken generally to encompass the aerospace industry.

We must assume that Mr. Eisenhower had considered his remarks and was conscious of the implications of such a phrase coming from him in the White House. For the record, here is the question and the reply:

Question: "Mr. President, following upon that same question, several Senators said that lately you have spoken out rather sharply to them about what you have termed the munitions lobby, which you feel has been bringing some pressure on some of the Congressmen to try to change your defense program and plan. Could you comment on that?"

President Eisenhower: "Well, I don't know who has a right to carry outside the White House any remarks I have been making, and to make those remarks public property. That is supposed to be a little bit of a private place over there, although maybe not always. (Laughter). I don't think I have used that word . . . in public. I do say this: I may have, but I am not saying I didn't, but I don't believe I have. I do say this: But there is obviously political and financial considerations gets into this argument, rather than merely military ones, and that is produced when people have to advertise very strongly about a particular thing companies do—obviously, something besides the strict military needs of this country are becoming influenced decisions."

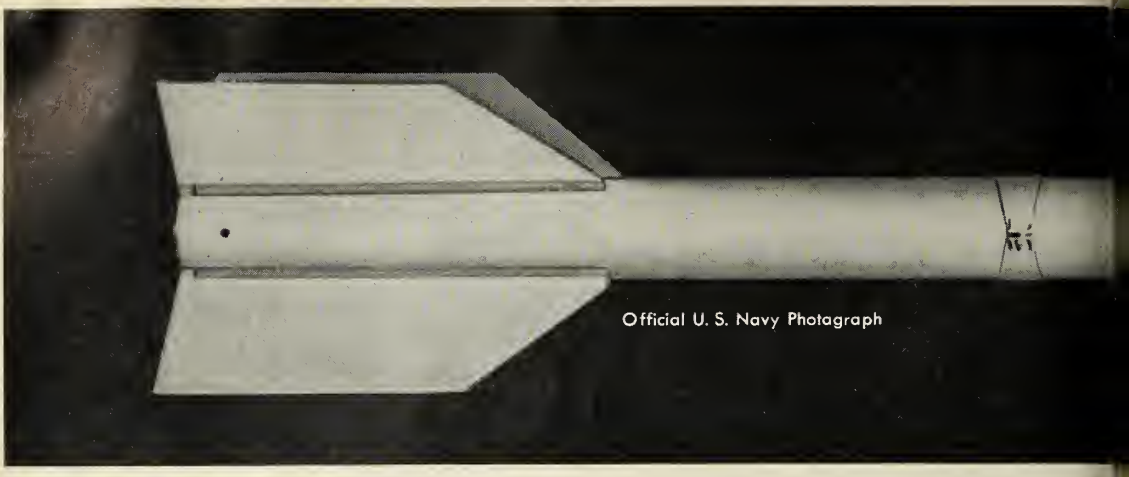
Writing in the New York Herald Tribune on the subject, Columnist Roscoe Drummond, himself a former Marshall plan official, commented:

"In talking about the pernicious influence of the 'munitions lobby,' President Eisenhower is raising a cry which will not soon be silenced.

"It will not be silenced until the facts are spread on the record—and the sooner the better. This is a serious complaint—that big defense contractors are bringing improper pressures to bear upon Congress and upon the Pentagon in deciding what weapons ought to be manufactured.

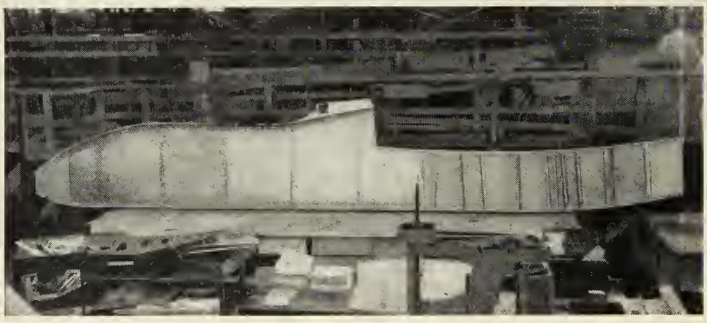
"This is the kind of issue which can become very political, very emotional and very distracting unless it is responsibly investigated. There will be a tendency to consider everybody guilty until proved innocent.

"I am not suggesting that the President's complaint is not a valid one. What I am suggesting is that Congress ought to investigate this matter promptly, calmly and with all deliberate speed—not drag it out."



If the aircraft/missile/space industry is not seriously alarmed at this appellation—which carries with it all the connotations of warmongering, war profiteering, the German Krupp cartel—it should be. This is a term the enemies of our country would love to, and probably will, pick up and capitalize on to the fullest in propaganda aimed both at our friends and at the uncommitted nations of the world.

Actually, if there is a munitions lobby per se operating in Washingon it has been pretty ineffective. Congress has been walloping the whole aerospace industry right and left lately on every measure it has supported on Capitol Hill. But this is not the real point. The lobby label will hurt just about as much true or untrue.



So let's indeed bring the matter out into the open. Congressman Hébert, chairman of the House Armed Services Investigating Subcommittee, opens hearings about July 6. The purpose of these hearings is to delve into the matter of the defense industry hiring retired military officers and why (see p. 15, this issue). This will bring a few headlines, but it is relatively unimportant to the greater question posed by the President's remarks: Does industry try to pressure Congress into approving purchase of weapons which may be obsolete, not needed, not the best, or unnecessarily expensive? Or, perhaps, in over-large quantities? Does this pressure extend to the military?

We would like to suggest that Congressman Hébert broaden his scope to bring the matter of the "munitions lobby" into the open where it can be examined. If it exists—beyond the scope of normal salesmanship—it would be far better to expose the sin and correct it. And if the term was misapplied that had better be understood, too, and quickly.

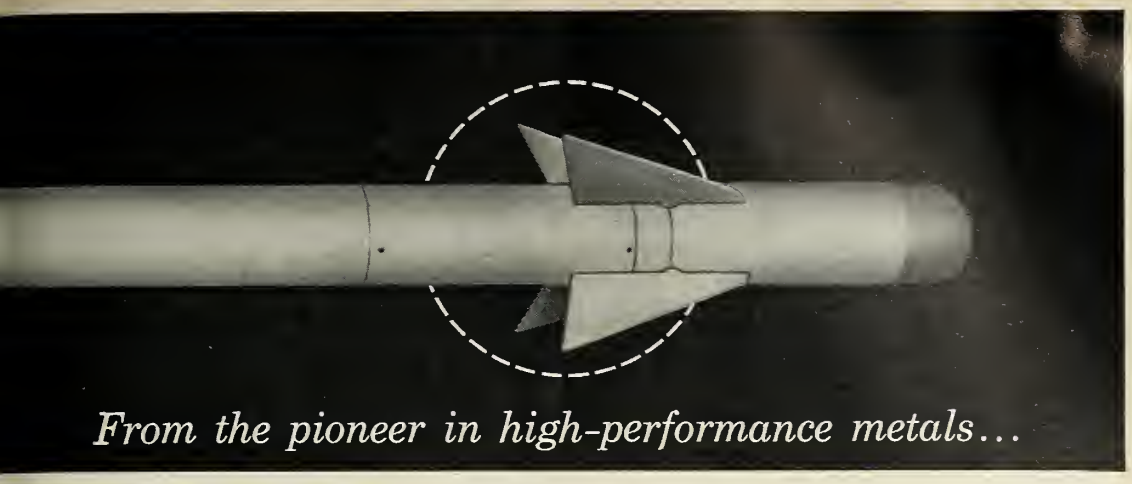
REPUBLIC TITANIUM is used in doze[n] of structural components and details i[n] the Martin P6M SeaMaster, including e[n]tire nacelle center beams such as the [one] illustrated. Commercially pure titanium [and] titanium alloys supplied by Republi[c] increase strength and heat resistance, re[duce] weight. Republic Titanium Alloys are a[mong] the strongest produced, offer exceptio[nally] high strength values at elevated [tem]peratures.

REPUBLIC'S NEW, TYPE HS6460 METAL POWDER is ideal for sinterings of highly stressed components in aircraft and missiles. Provides minimum tensile strength of 60,000 psi at 6.4 density as sintered . . . 100,000 psi after heat treatment. Less than .004% shrinkage from die size at 6.4 density. Available in quantities up to and including 12 tons or multiples. Can be used with existing operating equipment. Mail coupon for technical data sheet.



REPUBLIC ENDURO® STAINLESS STEELS—types 301 and 302—[are] currently being used by Solar Aircraft Company in the fabric[ation] of complete engine nacelles for Navy P2V patrol bombers. Sta[in]less construction offers greater strength, permits use of lighter ga[uges] increases corrosion and high temperature resistance. All types [are] readily formed into desired shapes by the usual commercial meth[ods]. Send coupon for complete information.

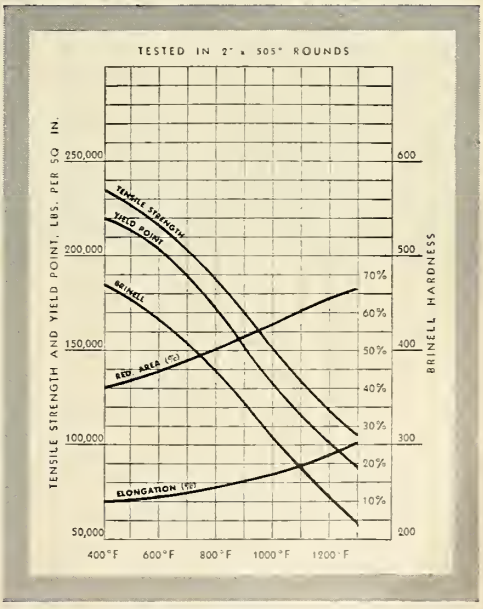
REPUBLIC

REPUBLIC STEEL

World's Largest Producer of Missile Metals—Titaniu[m]

From the pioneer in high-performance metals...

TYPE 4130 ALLOY STEEL FINS FOR THE SIDEWINDER



lose-tolerance, delicately contoured fins for the Sidewinder air--air missile are currently being produced from Republic Type 130 Alloy Steel by the Storms Drop Forging Company, Springld, Massachusetts. Choice of this high-strength alloy, according Storms, was dictated by extreme performance requirements.

Republic 4130 offers exceptionally high strength-to-weight tios with the highest strength values. As seen at right, tensile rength in the heat-treated condition is over 230,000 psi after mpering at 400°F., with a Brinell Hardness of 460. Uniform sponse to heat treatment assures complete deep-hardening enetration.

The Storms Drop Forging Company reports no production fficulties involved in the use of Republic 4130. Fins are produced om hot-rolled 1½" diameter 4130 bars in successive forging, ot trimming, grinding, wet tumbling, and coining operations.

Republic has pioneered in the development and production of w metals to resist heat, reduce weight, or increase strength. ith constantly expanding research as well as production facili-s and capabilities, Republic stands as the nation's largest oducer of *high-performance* metals—titanium, stainless, and loy steels.

Let us help you find the most advantageous use of these metals in *ur* project. Return the coupon for complete information without bligation. Please indicate if you would like a Republic Metalrgical Specialist to call.

tainless Steel, and Alloy Steel

the missile week

washington countdown

IN THE PENTAGON

The Navy and Army . . .

are planning to turn the Western Pacific into a missile skeet-shooting range. Training shots from *Polaris* submarines are expected to be used as targets by the **Western Electric** *Nike-Zeus* test base being built on Kwajalein Atoll in the Marshall Islands.

• • •

The Air Force . . .

faces a possible drag-out fight over the continued development of the Mach 3 B-70 bomber and F-108 interceptor—offensive and defensive companions in future use of the ALBM. Reason: The two programs may cost as much as $20 billion.

• • •

ARPA is Working . . .

on two secret satellite programs. One is called *Samos*. The other is called *Somnium*. R&D on both is scheduled at the Pacific Missile Range.

• • •

Another new name . . .

to watch for is Project *Notus*. This is the ARPA code name for a whole series of communications satellite programs including *Courier* and a 24-hour satellite.

• • •

Some nuclear-power experts . . .

are saying that Project *Rover*—the program aimed at developing a nuclear-powered rocket—is headed in the wrong direction. They contend more money should be spent on developing propulsion from controlled nuclear explosions. *Rover*, based on heating a propellant with a nuclear reactor, claimed a successful first test firing June 20.

• • •

ICBM's fired by training crews . . .

at Vandenberg AFB, Calif., will be aimed at bulls-eyes located between the islands of Wake and Eniwetok and Wake and Midway. The bulls-eyes have a radius of 10 miles and are equipped with hydrophones for measuring the accuracy of firings. Range equipment has been in operation since last month.

• • •

New basic research program . . .

being started by ARPA in search of new and exotic materials for missiles, spacecraft and other defense needs is expected to cost $15 to $20 million in FY '60—possibly double that in FY '61. Details are still to be worked out.

ON CAPITOL HILL

Blistering new report . . .

can be expected soon from the House Inf mation Subcommittee. It will give details some 50 refusals by the Administration release unclassified information—mostly connection with defense matters. Operati of the Atlantic and Pacific Missile Ranges expected to be singled out.

• • •

Greater pressure for . . .

a tough freedom-of-information law may sult from the report. Many congressmen ready are considering a proposed fede public records bill. It would force officials defend keeping something secret rather th the current reverse practice.

• • •

No matter what . . .

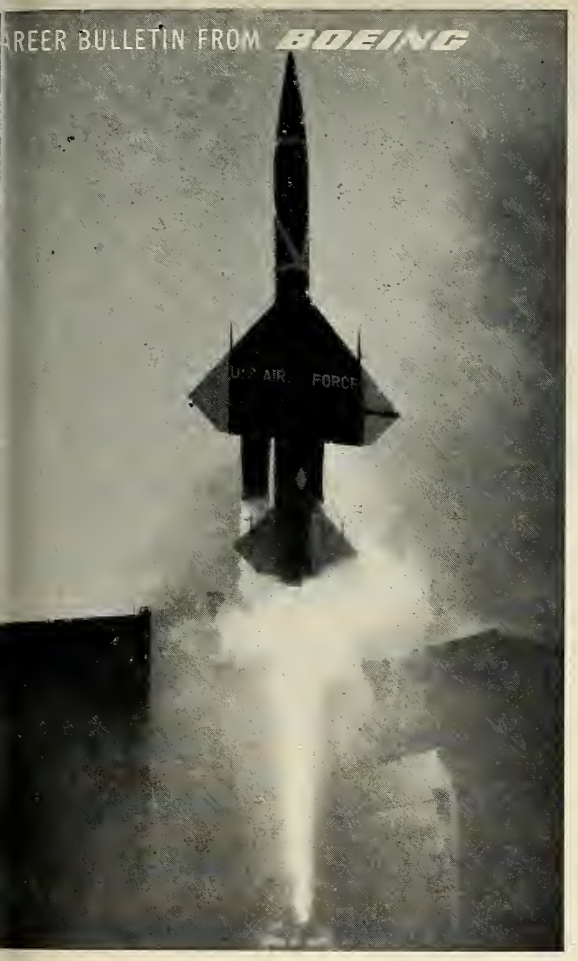
the final congressional decision on the s called "master plan" for air defense, ba issues involved remain unsettled. Some of t questions still to be answered: What servi is in charge of air defense? What defer does the United States have against a Sov Mach 3 bomber or a nuclear-powered bomb armed with ALBMs? Is the U.S. AICBM pr gram moving fast enough?

AT NASA

John W. Crowley . . .

head of NASA's office of Aeronautical a Space Research, will retire at the end of t month. Taking his place will be Ira H. Abb Assistant Director of Research. Milton Ames, Chief of the Research Division, w take Abbot's position.

AROUND TOWN

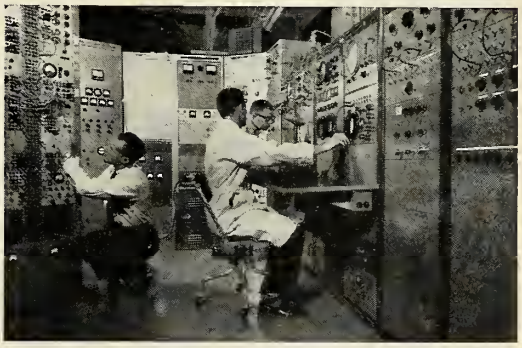


Some of the reports . . .

that are being passed as the "latest" in t nation's capitol:

. . . The advent of the **Boeing** *Minutem* and the era of ICBM-plenty will result in new blooming of U.S. isolationism.

. . . Continuing Navy pressure for a gre er role in space will lead to a new int service fight over military missions.



. . . Efforts to reach advance East-W agreement on such issues as internationaliz tion of the moon are considered dead a any early resurrection is considered unlikel

BLAST-OFF of supersonic Boeing BOMARC, the nation's longest-range defense missile. Now in volume production for Air Force bases under construction. Other Boeing missile projects that offer engineers and scientists outstanding career opportunities include Minuteman, an advanced solid-propellant intercontinental ballistic missile system.

SPACE-AGE projects are expanding at Boeing. Above is human factors laboratory in which problems of providing environments and controls for space vehicle crews are investigated. Celestial mechanics, lunar orbital systems and interplanetary systems are other areas that offer long-range space-age career opportunities to qualified engineers and scientists.

BOEING-DEVELOPED electronic counter-measures simulator, part of huge electronics installation. Boeing research and development facilities are the most extensive in industry. They could help *you* get ahead faster. Look into Boeing opportunities available now, in Research, Design, Production and Service.

SAILBOATS on Lake Washington in Seattle, boating capital of the U.S. Boeing headquarters are located in evergreen Puget Sound area, world famous for fresh and salt water boating, fishing, hunting, camping, scenic forests, dramatic snow-capped mountains, mild year-round climate. Wonderful Western living for the whole family!

Write today, *for your free copy of 24-page booklet, "Environment for Dynamic Career Growth." It pictures the career areas and advantages that could assure* you *a brighter future.*

AIRBORNE...NEW USAF T-38 TALON!

The T-38 Talon fills a vital requirement of the Air Training Command. It is a lightweight, low-cost aircraft in which our new generation of space age airmen can safely master the art of supersonic flight.

Pioneering a new Northrop family of economical manned aircraft for the space age, the Talon is a direct result of teamwork between Norair and suppliers. This T-38 Team that made the trainer a reality is now producing it under USAF contract at Hawthorne, California. Soon to follow is the N-156F multi-purpose fighter, American-designed for our free-world allies.

The T-38 Talon stands as the latest airborne evidence of Norair capability and production know-how. Norair's creative management further adds to the accomplishment by trimming production costs with methods that include PACE — the unique Performance And Cost Evaluation program; new and superior quality controls; and Norair-conceived, years-ahead production techniques.

NORAIR Hawthorne, California

industry countdown

STRUCTURES

Dyna-Soar Goes to Boeing

This is the latest word which M/R has garnered from sources in AMC, ARDZ, and USAF headquarters.

Here are the believed facts.

Team headed by Boeing is the victor. Sources say—and this is confirmed by M/R—that announcement of awards is closely guarded secret.

DOD confirmed that a "blanket" press release has been made—listing both Martin and Boeing.

Look for General Motors . . .
to move much deeper into missiles in the next two or three years. GM's defense business has shrunk from 20% of its volume in 1953 to about 4.5% today. Recently upped from chief of the Cleveland tank division to director of GM's **Military Products Division,** Harold R. Boyer has been handed job of whipping GM's far-flung manufacturing interests into a "team" to bid on entire missile systems—though GM presently lacks a rocket propulsion division. New organization may be centered around **A.C. Sparkplug Division** which has *Titan* inertial guidance. Says Boyer, "Our approach is for the long haul." Is GM eyeing any particular system now to bid as a prime? "No," says Boyer, "we are preparing for the future." But he indicates GM is already gearing to expand its subcontract defense operations.

• • •

Proposed service-wide TIF . . .
(missile/aircraft support equipment technical information file) reaches a critical point at July 9-10 meeting in Penatgon. Ad hoc Army-Navy-Air Force study group will attempt to iron out a system for collecting data, printing and distributing the catalogue which would be patterned after the new AF TIF (M/R June 15, page 21). Agreement will be necessary before DOD will proceed to next step—evaluation and funding.

• • •

Small businesses . . .
looking for government R&D contracts must file a Form 449 with SBA by July 17 to be included in the agency's new directory. The directory is used by government purchasing agents and prime contractors and is also made available to private industry.

Ablating beryllium shields . . .
six feet in diameter and one inch thick are being fabricated by Alcoa for two of NASA's *Mercury* space capsules on 50,000-ton press. Material is being supplied by **Brush Beryllium.**

• • •

McDonnell's *Mercury* contract . . .
calls for fabricating 12 space capsules. If NASA puts a man in space on the first try, what happens to the remaining 11? Says Wilson H. Hunter of NASA's Lewis Laboratories, "we may use extra capsules to train a corps of spacemen."

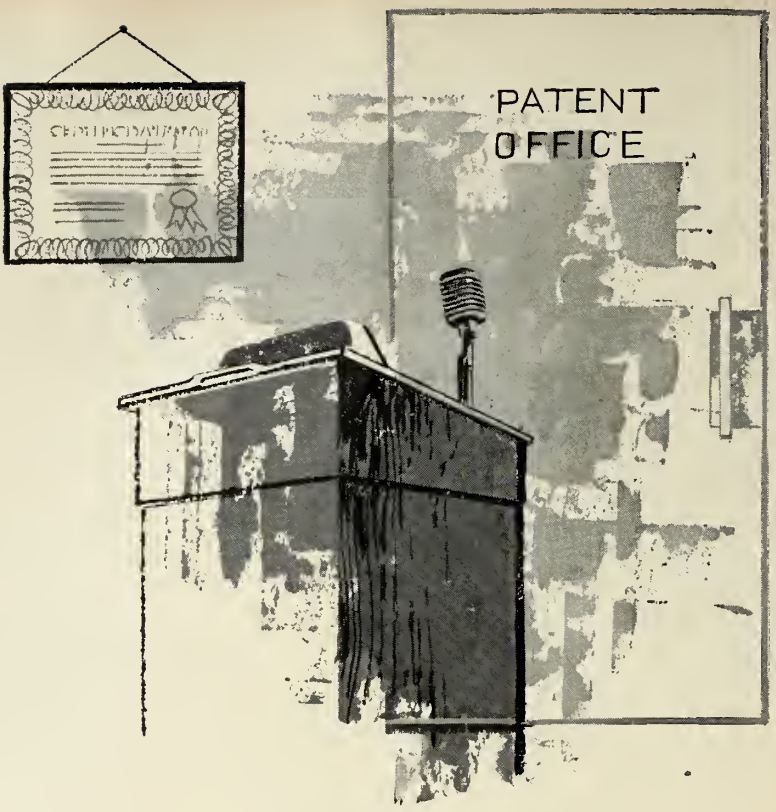
PROPULSION

***Atlas* launching system . . .**
employs a brace of pneumatic release cylinders produced by **Western Design Division, U.S. Industries Inc.,** which exert holding force of 836,000 pounds when engines are fired. Force is reduced to 416,960 pounds within .35 seconds. As missile lifts, during next .4 seconds, holding pressure drops in each release cylinder to 7600 pounds and pistons move 4 inches. Pistons then ride free 42 inches before cylinders break away from missile by means of surface cam-actuated segment lock.

• • •

Officials of Thiokol's . . .
Longhorn Division at Marshall, Texas, report passage recently of the two millionth accident-free man hour by division's 1400 employes.

ELECTRONICS



Under development . . .
by **Bell Laboratories,** an "improved" *Nike-Hercules* guidance system utilizing 68% parts common to *Hercules* and 32% new parts.

• • •

If and when *Nike-Zeus* . . .
is committed to production, guidance will be tested on **Chrysler** *Redstone* and *Jupiter* targets. Detroit missile makers believe a follow-on order for *Jupiters* is in the works and may be announced shortly.

ASTROPHYSICS

Huge Navy radio telescope . . .
being built at Green Bank, W.Va., theoretically will be able to peer 38 billion light years into space. Steel and aluminum dish weighing 20,000 tons will be more than 600 feet across; will have a 100-foot antenna in its center. Project (called Operation Big Dish) will cost $79 million.

How far can an engineer go at AC?

Inertial Guidonce Systems
•
Afterburner Fuel Controls
•
Bombing Novigational Computers
•
Gun-Bomb-Rocket Sights
•
Gyro-Accelerometers
•
Gyroscopes
•
Speed Sensitive Switches
•
Speed Sensors
•
Torquemeters
•
Vibocoll
•
Skyphone

If you are a graduate engineer in the electronics, electrical or mechanical fields, you a recognized as a *professional* when you work in AC's instrumentation business.

AC encourages you to write and present papers at professional society meetings. Wha more, if your original research and experimentation leads to new inventions, AC w assist you in obtaining patents.

You can also enhance your status through advanced training. AC offers three speci "in house" programs—for recent graduate engineers, for experienced engineers and f engineering supervisors. These practical courses constitute AC educational "extras" an are second to none in the country. They're offered in addition to the AC and Gener Motors educational assistance programs for men who wish to take additional studies nearby universities.

These are just a few of the advantages you'll enjoy while you work on AC's famo AChiever inertial guidance system or a wide variety of other electro-mechanical, optic and infra-red devices . . . for today and the "space age."

Step into the "space age" with the greatest name in industry . . . General Motors. Ju write the Director of Scientific and Professional Employment: Mr. Robert Allen, Oa Creek Plant, Box 746, South Milwaukee, Wisconsin.

AC SPARK PLUG ✻ THE ELECTRONICS DIVISION OF GENERAL MOTORS

Can Congress Define 'Influence?'

by James Baar

WASHINGTON—Some 2500 years ago mart Greek named Plato and some his chums stood around Athens and d to answer the question: What is uence?

The House Armed Services Investi- ions Subcommittee will take another ck at the problem next month with red high-ranking military officers, ense contractors and the Pentagon he heart of the discussion.

The subcommittee—headed by Rep. Edward Hébert (D-La.)—began paring for the investigation more n a year ago in conjunction with rk on its current investigation into weapon system management con- t.

But the full-scale public hearings eduled to open about July 6 received ir present headline status from a nber of most recent developments:

• The bitter, drawn-out fight over *narc* and *Nike-Hercules*.

• President Eisenhower's "attack" "the munitions lobby."

• The House defeat by only one of a proposal by Rep. Alfred E. tangelo (D-N.Y.) aimed at barring ense contractors from employing ior military officers for five years r their retirement.

At this point, Chairman Carl Vin- (D-Ga.) of the House Armed vices Committee directed the Hébert committee to proceed promptly h its investigation. He said it should lude retired federal civilian officials well as ex-military officers.

Vinson, who has shown growing dis- asure with defense contractors, urged ctment of any remedial legislation t might be needed.

• **Flood of questionnaires**—The bert Subcommittee responded by ding thousands of questionnaires to nation's 100 top prime defense con- ctors who have 75% of the gov- ment's defense business. It then sent ilar thousands to some 600 prime tractors who have the other 25% to some 30 defense industry as- iations.

All were asked to have all retired itary officers on their payrolls above Army-Air Force rank of captain the Navy rank of lieutenant fill out forms. They also were asked to e all former Federal employes who n more than $10,000 a year and o have retired within the last five rs fill out special civilian forms.

In essence, the questionnaires ask: Just what do you do? And what are you getting for doing it?

They put it this way:

"State whether you have solicited or participated in any discussions, oral or written, concerning sale, use, adaptation, modification, improvement, suitability, development or research of any article, plan, process or program with any officer or employe of the Department of Defense at any time since your retirement, and at any place, on behalf of any company, organization or yourself."

"If your answer to the foregoing question . . . is 'yes', state the subject of such discussions, conversations or writings, identify the persons with whom the exchanges took place or the circumstances under which they occurred."

"What compensation or remuneration, direct or indirect, in money or anything of value, are you receiving or have you received for the service performed?"

• **What's taboo?**—Behind these questions are the already-enacted laws restricting both retired military and civilian officials in their dealings with the Federal government.

All military and civilian officials are banned for two years from selling to the Department of Defense. Moreover, retired military officers are prohibited forever to sell anything to their former service. And retired Navy and Marine officers must forfeit retirement pay at any time that they are engaged in defense selling. Penalties for violations range to a maximum of a year in jail and a $10,000 fine.

But the crux of the problem is: What is selling? And this comes back to the question: What is influence?

Santangelo, in arguing for his proposal, told the House: "prominent military figures in retirement can have a great influence over their former subordinates."

"Persons within the department who may be looking forward to possible employment within a certain organization after retirement can display partiality and favoritism without ever realizing it," he said.

"Contact at social and professional gatherings between active and retired officers can provide a perfectly natural setting for influence and favoritism."

Maybe so. But Defense Secretary Neil H. McElroy told a news conference the Defense Department is not aware of improper influence by retired military officers.

Also, he said "retired officers of our military services have done very good work in behalf of defense production." And he warned against loss of retired officers' "minds and their experience."

Rep. Samuel Stratton (D-N.Y.) warned the House during debate on the Santangelo proposal that by passing it "we would be throwing out the baby with the bath."

• **What will happen?**—The Hébert Subcommittee will analyze its questionnaires and add the results to considerable information already in its possession. Then it will call in the witnesses—almost certain to be mostly a parade of retired generals and admirals.

The investigators will try to determine not only whether retired military officers have attempted to influence military purchasing, but also:

• Were such attempts—if made—successful?

• Does a "munitions lobby" really exist? If so, who are its members? (Only about three dozen names connected with the defense industry appear on the list of hundreds of registered lobbyists.)

• If changes are needed, how can they be made without causing more harm than good?

Hébert has repeatedly promised a high-level investigation conducted in all fairness. But the pressures to turn it into a headline-making circus will be great.

Several Congressmen—none members of the Hébert Subcommittee—have already released long grab-bag lists of retired military officers employed by defense contractors. One list included a retired officer who heads his firm's plant hospital.

Also, take this sample of possible testimony for example:

Q: "Admiral (or General), did you have lunch April 1 with Admiral (or General) Jones, a key figure in the XYZ contract decision?"

A. "Yes, but we only talked about golf and baseball."

What might be made of this exchange in the glare of TV lights and headlines? But even worse, what fair judgment can be passed in such matters? Was influence exerted?

This is the problem the Hébert Subcommittee and the defense industry face.

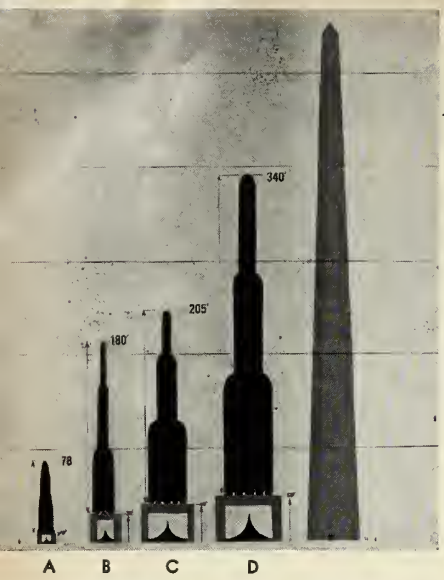


FIG. 1—Imaginary family of vehicles starting with *Atlas* compared with the 555-foot Washington Monument.

How to Handle 24-Megaton Thrust?

Special logistics will be needed for 1.5 million pounds-plus boosters

by Chauncey J. Hamlin Jr.*

LOS ANGELES—What are the support problems entailed in handling and launching a 24-million-pound-thrust rocket of the future?

The whole new generation of boosters of over 1.5 million pounds will involve special logistic requirements for transporting the rocket from the factory to launch site, erecting and completely preparing it for flight.

In setting forth some of these problems here, it is proposed to stimulate thinking on logistics in this large vehicle area and call to the attention of preliminary designers some of the problems associated with size. This discussion, moreover, will be confined to chemically fueled multi-meg rockets.

Since these systems will be very costly, every effort should be made to simplify ground handling problems. For instance, the cost of developing the prototype ground support equipment for the *Dyna-Soar* has been estimated at $60 million. As the size of the vehicles continues to increase, handling cost will go up proportionately.

One of the best ways to keep costs down is to consider handling and other logistic requirements as part of preliminary design. If planning in this area is started early in the game, simplified concepts of handling can be built into the system with appreciable dollar savings.

A 1.5-million-pound-thrust chemically fueled rocket powerplant is under development and will be available in the very near future. The development of engines with up to 20 million pounds of thrust is predicted in the early 1970's. Dan Kimball, president of Aerojet-General, makes a similar forecast in referring to rocket engines having "10 or 15 million pounds thrust."

• **Growing family**—To appreciate what these thrusts mean in terms of overall rocket size, consider Fig. which depicts a family of rocket-po ered vehicles, starting with the famil *Atlas* and increasing in size by m tiples of 4. This imaginary family, rived for the sake of size comparis is based on the following assumptio present state-of-the-art chemical fu with an impulse in the 250-260 s range at sea level, a mass ratio of 0 an initial acceleration of 0.3 g, and overall propellant specific gravity of

FIG. 2—Gantry with elevator would permit lifting upper stages and slid lower stages under them, structure rising as successive stages are install

*Corporate Development Planning Staff, North American Aviation, Inc.

en the thrust reaches 24,000,000 nds, the vehicle envelope approaches of the Washington Monument, a ewhat unbelievable structure.

What then are the principle new s of logistics facing the operator of a vehicle? First, there is the prob- of how to get a large booster from factory to the launch site. There severe limitations on current con- ional means of transportation by oad, highway or air transport. Size rictions of tunnels and highway passes make it obvious that any or structure with a diameter ter than 10.7 feet will require spe- handling.

A diameter somewhat in excess of feet can be transported over the on a trailer, but special permits special routing are required. Here here a look at handling problems y in the design phase will pay off. ecomes apparent that for conven- al transportation the design will re- e breaking the frame down into nents for shipment.

• **Where to build it?**—One alterna- of course, is fabrication at the ch site. Evaluation of the pros and of building block construction and of shipment versus construction he launch site should be made be- vehicle designs are finalized. ght penalties associated with mul- tank construction should be eval- d against the complexities of ch site fabrication. Fabrication at otely located launch sites such as e of those proposed for equatorial chings may prove far more costly he over-all program than the loss in performance associated with a booster built up of easily-transportable components.

For instance, an equatorial launch site where average temperatures are 80° and the relative humidity is between 80 and 90%, would require large air conditioned shops, would be far from normal industrial supplies and would require all of the necessary housing, etc., for the working force, which in itself would be difficult to recruit for such a location.

• **By water**—Another alternative exists where the frame manufacturing plant is located on a waterway and the bulky parts can be transported completely assembled by barge or ship, to a launching site that is also adjacent to port facilities. As a matter of fact, if taken into account during the initial planning phases, water transport of large boosters may easily determine the location of launch sites and manufacturing plants in a manner which could materially reduce the overall cost of a program.

Add to the ease of handling by marine methods the desirability of launching over water for safety considerations and launch sites adjacent to marine facilities appear highly desirable. In some recent studies of equatorial launch sites, the proposal has been made to utilize the highest ground available, often 2-3000 ft. above sea level for launch pads. I believe that a look into the future would relocate these to sea level at a great saving in cost.

• **400-ft. gantries?**—Having arrived at the launch site, the operator next faces the problem of erecting and servicing the rocket. To erect and service a 340-foot 24-million pound thrust vehicle standing on a 50-foot launching and flame deflector platform will require a gantry in excess of 400 feet high. The question immediately arises —is it practical to consider a structure this size? And if so, is it practical to move it away from the rocket for launching or will the ship have to be fired from within the structure?

In launchings from within the structure, exhaust flames can do extensive damage if vector control requires deflection of the jet onto the gantry. Wind drift during initial flight at low acceleration can endanger the rocket due to collision with the gantry. The complexity and cost of this system forces us to look for an easier way out.

• **Alternatives**—What avenues are there? One is to use a gantry with an elevator and, instead of stacking the upper stages upon the lower as is presently done, lifting them up and sliding the lower stages in beneath, so that the structure rises above the gantry as successive stages are installed (see Fig. 2). In this instance, the upper position of the elevator platform would only have to be high enough to permit the largest continuous section to be rolled into position beneath it.

Approaching the problem from a different angle, let us consider assembling the vehicle in a hole as shown in Fig. 3. The size and complexity of the gantry can be greatly reduced. By the time this rocket reaches the flight test stage, we shall have had a great deal of experience in launching missiles

3—Assembling vehicle in hole d cut gantry size complexity.

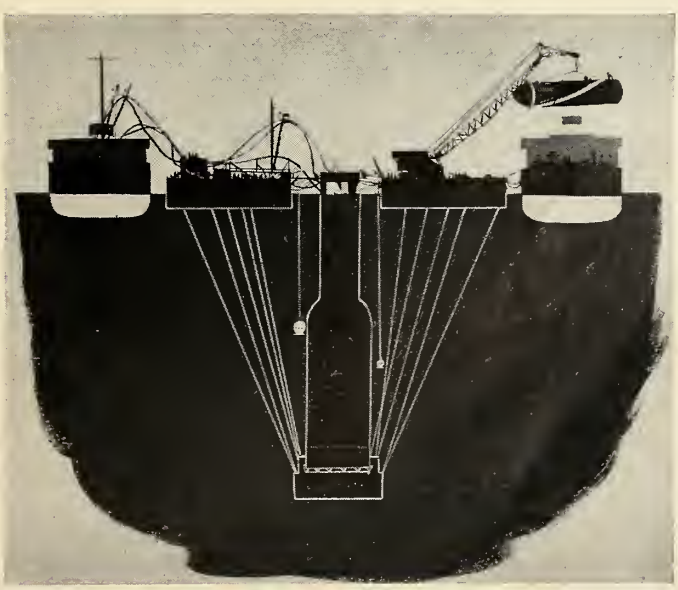

FIG. 4—Submerging missile in ocean is another possibility. As with the hole, the vehicle here could be raised to tbe surface for launching.

from holes in the ground, i.e. *Minuteman* and *Titan*. Of course, the complexity of constructing the hole and launching from it will have to be weighed against surface launching. After the rocket ship has been assembled in the hole, the possibility exists of raising it to the surface for launching if subsurface launching proves impractical.

Another scheme might be to submerge the missile in the ocean as shown in Fig. 4. Experience gained in underwater launching of the *Polaris* will provide many of the answers to submerged launching problems. Again, as in the case of the hole, the vehicle could be raised to the surface for launching.

It would appear at a first glance that the equipment associated with submerged or waterborne launching would be far less complex and costly than other types. Shipyard handling techniques already well-developed are available and the entire facility could be afloat. An added advantage of such a launching arrangement would be the ability to use it at many different locations, depending upon the mission of the flight, since it could be towed from one site to the next.

Another means of reducing the handling problem is to minimize the overall vehicle height by designing the stages to telescope into one another. Such a rocket would be rather squat with poor aerodynamic qualities, but these drawbacks might easily offset the cost and complexity of stacking one stage upon the other.

• **Two million gallons**—With the missile erected on the launching platform, cleaned, checked and ready for propellant loading, we are still faced with quite a problem in logistics insofar as our 24-million-pound-thrust giant is concerned. Approximately two million gallons of propellant must be pumped into the tanks. Servicing by conventional highway transport tank trucks would require the capacity of 666 such vehicles or 200 standard railroad tank cars. The problem of moving this equipment in and out of the launching area is immediately evident.

Again, a dock-side launch site appears superior, as propellants could be pumped directly from ocean-going tankers standing offshore. So far, only liquid propellant engines have been considered. If solids are to be used in these large vehicles, it would appear that they will probably have to be loaded at the launch site in much the same method as liquids, in order to simplify handling problems. High-capacity continuous mix processes will have to be developed for this purpose.

• **Boarding**—The problem of servicing the upper stages and putting the crews aboard in the case of rocket ships which are erected without the use of full-length gantries, or after the gantries have been removed, must be solved in an economical manner. The crew in particular should be boarded at the last possible moment, so that they are not subjected to extended periods of waiting.

One of the best ways to accomplish this for ships that are not too tall would be the use of cranes with lightweight aluminum booms. If height becomes excessive, helicopters with personnel platforms suspended by cable could be employed. It might even be possible to suspend a lightweight elevator sustained by means of captive balloons. (see Fig. 5).

In considering logistics for large rockets of the future, reliability of all phases of the equipment should claim first place—with overall system cost, a close rival. In general, the speed of launching preparations will not be an objective for nonmilitary missions—equipment can be kept unsophisticated and to a large degree, manually operated. Cost can always be kept to a minimum by using standard equipment when available. Design can always be simplified if a piece of equipment is not required to perform too many functions.

FIG. 5—Helicopters or balloons might be used for boarding crew members.

Medaris Gives His Basic Procurement Philosophy

DETROIT—An Army general r cently explained to the missile-spa industry the procurement philosop which governs the intelligent expen ture of some two billion dollars a nually in support of the Army's miss programs.

Maj. Gen. J. B. Medaris, comman ing general of the Army Ordnan Missile Command, addressed the se ond annual Industry Missile and Spa Conference here.

General Medaris' Command is r sponsible for 14 major missile systen including their ancillary equipme from the inception of the progra through production, fielding, supp and maintenance of the systems so lo as they remain operational.

• **Basic points**—The general su marized a one-hour presentation w "a few basic points of basic philosop that I consider far more essential th any matters of procedure:

1. "The procurement activity m support directly all of the work of parent organization, whether that wo be directed to development, to produ tion or to follow-on support of miss systems.

2. "All of our activities in procu ing goods and services must be bas on a firm, positive, and knowledgeal control of the work to be performed.

3. "In dealing with all segments industry and research activities, it our objective to be fair, but not to generous.

4. "The contractor selection, in th difficult area where only a minority our total needs can be so defined as permit standard sealed-competitive bi our selections must be founded on cold-blooded and objective apprai of the requirements to be met, of t realities of time and money requi ments, and of the capability and abo all the reputation for effective resu as applied to each contractor co sidered.

5. "By single and tightly coord ated management control, we must sure the maximum effective telesco ing of all of the finished activities volved in fielding a weapon syste keeping in mind that the effectiven of the system is strictly related to time of availability, and requires th the longer a program continues t higher the total cost."

Gen. Medaris added that "no w pon system development is worth c time or the taxpayers' money unless an end product we will have a syst that is effective when it hits the fi and for a reasonable period thereaft that is usable by the troops, and th is economical . . ."

Priority Rules Are Revised

by Betty Oswald

WASHINGTON—Manufacturers of ellites and intermediate and long-ge ballistic missiles will continue to a priority rating to get the equip-nt and materials they need to pro-ce in accordance with military sched-s.

The bottleneck-breaking priority X) is part of Defense Materials tem as it will be revised by the siness and Defense Services Ad-nistration shortly after July 1. The v rules will be effective in the third endar quarter which starts Oct. 1.

They will continue to provide ma-nery for distribution of steel, cop-and aluminum to defense contrac-s on a simplified basis. Nickel alloys d aluminum molten metal, foil and wder have been made controlled ma-ials.

Non-nickel bearing stainless steels ve also been made controlled ma-ials, but all steel castings, includ-stainless steel castings and nickel oy castings, have been deleted from list.

The decision to maintain and revise system followed conferences be-een Business and Defense Services lministration of the Commerce De-rtment, which administers the pro-m, and some seven industry groups cluding aircraft and electronics in-stry advisory committees. It was edicated on the belief that the ma-nery is needed to determine the use tterns of materials by defense con-ctors which help to set stockpile re-irements and the controls which uld be needed in the event of a ure mobilization program.

The system is also called necessary identify defense orders so that when ivery problems arise as a result of rtages, strikes or bottlenecks involv-materials or components, action n be taken to expedite deliveries. In 55, when defense contractors were ting more metal because of higher duction rates, some 8000 cases were ndled by the BDSA in efforts to get contractors what they needed. The rrent load amounts to about 4000 es annually—without counting the ormal expediting actions taken by my, Navy and Air Force under the hority provided by the Defense Ma-ials System.

• **Background**—DMS had its gen-s in the Controlled Materials Plan World War II and its revival, in dified form, in the Korean War. Basically, it's a method of distributing steel, copper and aluminum in mill forms and shapes to defense contractors and manufacturers of essential civilian goods. In a sense, it can be described as a rationing system.

However, experience has taught that it takes about a year to make the system work efficiently if statistical information is not available to show both the pattern of production of controlled materials and their consumption. After the Korean War, it was decided both by Government and industry that the system ought to be maintained on a modified and relaxed basis so that there would be no long time-lag in the event of another war or mobilization.

About six years have gone since the establishment of DMS, during which the Congress has continued the Defense Production Act on which the system is based. Relatively few changes have been made in DMS up to this point, although many have been suggested both by Government and industry.

• **Simplify and clarify**—Current changes are aimed at simplifying the rules without losing the priorities and statistical features of the system as well as the basic control machinery which could be made effective in the event of need. Second objective is to clarify certain gray areas and spell out the rules in black and white.

Among the major changes planned are a simplification of the definitions. Perhaps the most important of these changes makes construction and research projects a part of the Class A products, for which direct allotments of materials can be made. Industrial service operations are made Class B products, which are handled on the basis of automatic allotments.

Contractors will no longer be troubled with the problem of authorized production or construction schedules on which allotments were based. Under the new rules, the right of defense contractors to rate their orders and to an allotment of controlled materials flows from a rated order or contract or from a specific authorization.

Allotments of materials will be made under the new rules by the alloting agencies (Defense Department, Atomic Energy Commission, etc.). Prime consumers will no longer be permitted to make allotments to their subcontractors. Use of allotments, ratings or self-authorization by producers of Class A or Class B products having rated orders is mandatory except for purchase orders of $100 or less.

Purchasers of controlled materials are required to furnish suppliers with a prescribed statement that DMS rules must be followed in all cases where orders are placed for Class A or Class B products or authorized controlled materials orders.

Producers of Class A and Class B products extend their ratings to their suppliers.

• **Use of symbol**—As far as the bottleneck-breaking DX symbol is concerned, contractors are now required to use it and controlled materials producers are required to schedule the authorized controlled materials orders so identified without regard to lead-times or to set-asides set up under various production orders.

There will be a new schedule listing the authorized program identifications and alloting agencies. In addition, there will be a schedule containing a form for submitting a statement of controlled materials requirements when requested. However, unless there is a drastic change in current thinking, this request is not likely to be made very often.

BDSA is also trying to make the system more palatable for the controlled materials producers. Maintenance of the system is being described as a kind of insurance policy. The premium is represented by the cost of bookkeeping and related procedures involved.

William C. Truppner, Director of the Office of Industrial Mobilization, in summing up the decision to continue DMS, said that it was the intention of the Government to assure a top priority for ballistic missiles and satellites on the books of the controlled materials producers who are required to schedule orders for these programs, regardless of set-asides or leadtimes. However, an escape clause is provided which says: "Unless it is impracticable for him to make delivery within the required delivery month in which event he must accept such an order for the earliest practicable delivery date."

Generally speaking, the producers of materials prefer DMS as modified to a priority system. However, most of them believe that BDSA must do a better job of educating the contractors and distributors, so that the system works with a minimum of waste motion.

A Crisis in Range Instrumentation

AFMTC commander says more funds and effort must be expended to cure the rapidly widening time bottleneck

by Maj. Gen. Donald N. Yates
Commanding General, Patrick AFB

Mr. Chairman and members of the American Rocket Society—I wish to commend you on the organization of a Committee on Logistics and Operations. I think it is quite significant that the American Rocket Society now extends their concern over a broader area than just the research and development aspects of rocketry. One of the support areas of concern to the Committee on Logistics and Operations has a direct bearing on the success of the research and development program. This area needs attention and emphasis by the American Rocket Society and by the missiles and space vehicle community at large. The subject is the range instrumentation of the future.

The Air Force Missile Test Center has pointed with considerable pride to the fact that it has been able to grow and expand in pace with missile developments of the last ten years, particularly since the emphasis was placed on ballistic missiles during the last five years. The growth at the Atlantic Missile Range has been phenomenal, and we are proud that the vast majority of test data requirements have been met, on time, with instrumentation of the required precision and reliability.

With the spotlight logically enough resting on the missile programs themselves, it is only natural that supporting facilities, such as are provided by our range and its instrumentation, are too often taken for granted. It is a fact that for the past five years we have been driven into a frantic race with missile performance in our job to provide instrumentation of commensurate performance. We must match each masterful achievement in vehicle performance with an equivalent achievement in instrumentation performance.

• **Gaps to come**—Whereas our best instrumentation may suffice today, it falls far short of the requirements for the future. I see a gap forming which becomes wider upon close comparison of our future measurement requirements versus the state-of-the-art in data acquisition. For example, in electronic tracking we are being asked to improve our accuracy, not by a factor of two or three, but by one order of magnitude, to accommodate a second generation missile soon to be tested.

Explorations in space will bring about their own family of requirements which, a few years hence, will probably relegate today's space-tracking equipment to the class of primitive first attempts. There can be no question about the need for increased emphasis on instrumentation development. Our ability to advance in both ballistic missile and space work may, in fact, be determined by our achievements in the field of instrumentation development.

• **Past build-up**—When we began the build-up of the Atlantic missile range in 1950, we were able to draw upon the developments that had been achieved during World War II. With some improvements, the instrumentation equipment then available was adequate to meet the requirements imposed for the long-range cruise missiles and short-range ballistic missiles of that time period. Modified SCR-584 fire control radars, telemetry equipment constructed in accordance with RDB standards of 1947 and command co trol equipment used for drone conti during the late 40's, provided the ran with instrumentation that served well for a number of years.

The rapid build-up of our ICB programs beginning in late 1954 i posed significantly more stringent r quirements on instrumentation. The programs required far more accura position and velocity measuremen than had previously been necessa and at substantially greater slant ran distances. The telemetry requiremen increased in quantity, but fortunatel not very much in complexity. As wi the cruise missiles, it is still necessa to measure the actual impact locatic with great accuracy at distances of u to 4400 n.m. from the launching poin The limitations of our instrumentatic system to measure the actual impa location made it necessary to establis impact points adjacent to inhabite land masses. This, in turn, impose severe range safety problems and r quired the establishment of mo sophisticated range safety instrumenta tion.

In order to meet the requirement imposed by the ballistic missile pr grams, we exhausted the backlog th had been accumulated from our wa time developments. We were har pressed to meet many of the require ments of the ICBM programs. We wer oftentimes forced to use an assortmer of instrumentation systems obtaine from various sources to meet a singl requirement. In some cases, compro mises in missile test requirements wer made due to the exorbitant costs in curred by the use of these assorted an extensive systems.

• **Scraping the barrel**—We are no at the bottom of the barrel, so t speak, in instrumentation development We would like to initiate a majo development effort on a new trackin system during this fiscal year; however funding limitations have dictated tha

Editor's note—Due to the critical importance of adequate range instrumentation in the progress of our missile program, M/R feels this paper presented at the recent American Rocket Society meeting is of extreme interest to all in the missile business. General Yates points out the gaps in present instrumentation technique and equipment, the results of our inattention to the problem, and what must be done immediately to narrow the ever-widening gap.

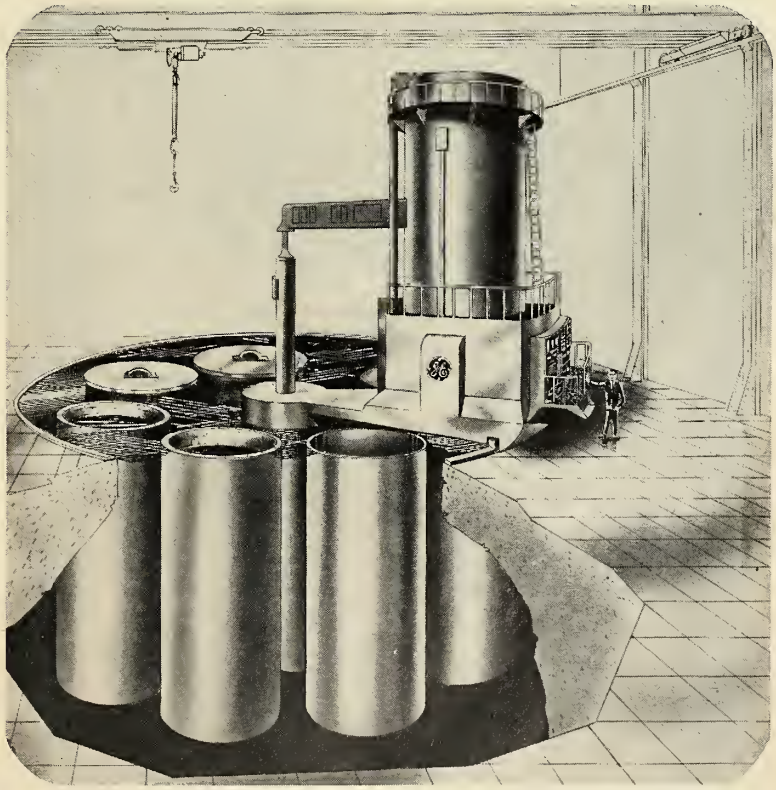
must be deferred.

We must get this equipment developed and installed on the range if we are to meet presently known requirements. It is not difficult to foresee aeronautic systems of the future with more demanding requirements than can be met even with this new equipment.

• **Call for funds**—Based on the level of funding for instrumentation development during the past several years, we cannot hope to get the job done without a complete about-face. The funds expended on the Atlantic Missile Range for development of all instrumentation are a very small fraction of approximately the cost of the production missiles themselves. It is not unusual for the Range to be asked to evaluate a new guidance system that may have cost one hundred million dollars or more with an instrumentation system that has cost a few percent of what the guidance system cost. In most instances, the only solution has been to obtain funding assistance from the weapons systems people to buy, modify, and install "off the shelf" equipment on a crash basis to obtain marginal results.

The developer of instrumentation, in order to be effective, strives for two paramount goals in his product—maximum accuracy and one hundred per cent reliability. To properly evaluate vehicle performance, range instrumentation should be one order of magnitude better in accuracy than the performance parameters of the system under test. Certainly, we all agree that malfunction or impaired accuracy of instrumentation will invalidate a portion of the vehicle test objectives. To obtain the high degree of accuracy and reliability in instrumentation systems, sufficient funds are required: 1) to improve existing systems; and, 2) to develop systems based on new concepts.

The development of instrumentation to meet the exacting demands imposed on the test ranges is a slow and tedious process. Generally, we have found that it takes as long (and sometimes longer) to develop an instrumentation prototype as it does to develop new vehicle prototypes. When the missile contractor has his prototype complete, he is ready to test it. On the other hand, the range usually will require some production units of the developed instrumentation system to meet the test requirements of the new vehicle in addition to the prototype.



• **The bottleneck**—Thus, the "bottleneck," from a time aspect, is instrumentation. For example, several major instrumentation systems used to support the ballistic missile operations on the Atlantic Missile Range required an average of about four years for development. If you add to this the amount of time required for the budget cycle, plus the time required to check out and "de-bug" the system after it is installed, the average time from inception of the need to an operational use of a complex instrumentation system can be as great as five to six years.

A partial answer to the lead-time problem is to place the instrumentation developer where he can have continual cognizance of what the missile people are developing in the way of new vehicles. I recognize that such an approach is difficult to implement for a variety of reasons.

Systems contractors do not have a clear outline of test needs until the actual test stage is near. Consequently, they are reluctant to release the advance information we need to proceed with our development plans. A better solution from a Range viewpoint is to permit the development of new instrumentation to proceed, not on the basis of known missile requirements, but solely to advance the state-of-the-art against the trend of technical requirements as forecasted by our top missile and astronautic people. ARDC has an applied research program oriented toward such goals; however, these projects must compete with more glamorous end-item developments for their funds.

I doubt that there is any complete answer to the instrumentation development problems that the test ranges face today. Certainly, some breakthroughs are necessary in the state-of-the-art if we are to satisfy the data acquisition needs for future vehicles. The test ranges earnestly solicit the constructive suggestions and ideas of this Committee in the establishment of performance criteria for the next generation of instrumentation which will provide the desired test data for the next decade . . .

Heat Treatment for Solid Cases

PART OF A multi-million dollar expansion program at GE Evandale is this heat treating facility for solid rocket cases. Scheduled to be in operation in March, it will handle cases 10′ in diameter and 30′ long. It can be expanded to process cases 40′ in length. Evandale also will put into operation next year a hydro spinning machine believed to be the world's largest.

Adapting Man to His Life in Space

by James Baar

WRIGHT-PATTERSON AFB, OHIO—The most complex part of any space craft will be man.

Today hundreds of scientists are working on projects costing millions of dollars in an attempt to better understand how this key part works—and how to make better use of it.

The complexity of the problems involved is tremendous. But the results are expected to pay off not only in helping man in the conquest of space but in widespread application to life on earth.

Much of this work is under the direction of the Aero-Medical Laboratory's Engineering Psychology Branch at Wright Air Development Center. Here are seven areas under study:

• Efficient work and rest periods—A million-dollar program being conducted by the Lockheed Aircraft Corp. at Marietta, Ga., aimed first at determining the most efficient way to break up the day for men aboard a space craft.

Volunteers perform assigned tasks in a specially constructed space cabin while extensive data on their reactions is collected by observers. The work-rest cycle will be varied from two hours on duty and two hours off to eight hours on and eight hours off.

• Ionized air—An investigation to determine the effects on astronauts of ionization of space cabin air caused by operation of electronic equipment.

Preliminary results show that positive ionization of the air causes crew members to suffer headaches, hay fever and asthmatic disorders. Some reports say positive ionization also causes feelings of depression. On the other hand, negative ionization appears to result in a feeling of well-being bordering on euphoria.

• Information handling—The collection of ever-greater amounts of data by electronic means has led to the problem of finding new ways to process and act upon it rapidly. This problem is expected to become particularly acute in manned satellites and space craft.

Researchers are attempting to come up with solutions based on simplified design of equipment.

• Magnetic fields—An investigation into the effect on astronauts of passage through magnetic fields of various intensities as well as proximity to magnetic fields possibly used to contain nuclear energy.

• Control Panels—Researchers are attempting to determine whether the time spent by a pilot looking at indicators on his instrument panel display area can be resolved into a patte

The goal would be replacement all indicators with one screen wh would flash readings in a similar p tern. This would save considera weight through miniaturization. P sibly time could be saved, too.

• Man as a "Black box'—An tempt to describe man in mathemati terms and hereby fit him into complex system of a space craft.

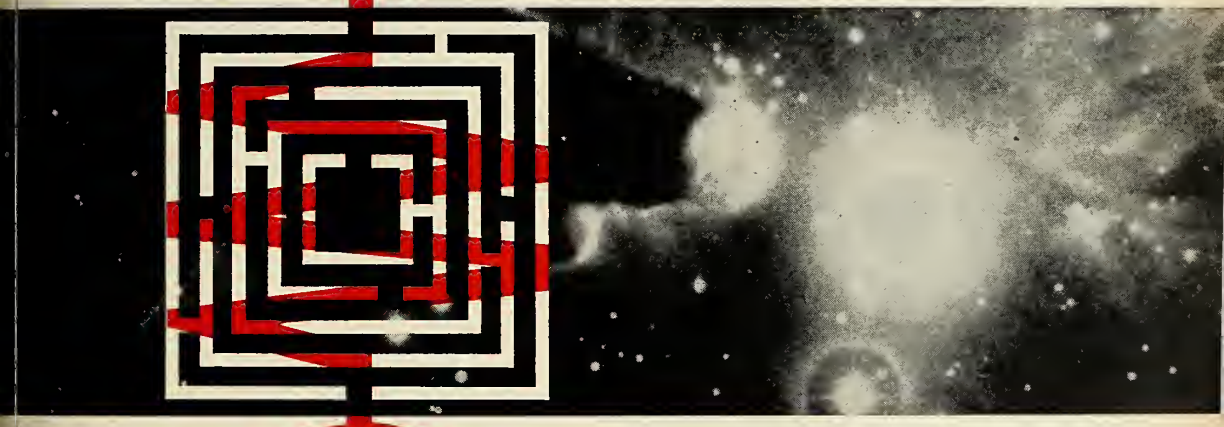
Researchers are operating on concept that of all the electronic "bl boxes" that make up a missile or sp craft, man is by far the most comp "black box" of all. The astronaut the Space Age is seen more and m as a manager and less and less as stick puller.

• Available light—In order to c serve precious electric power, or cause of inability to carry large pov sources, astronauts may face operati in very dimly lit space craft.

Researchers are attempting to termine whether lighting can be i proved by providing a series of 20 30 brighter flashes of light a seco rather than a continuous dim bea This would be the same as reduci the flicker of a normal fluorescent t about 70 to 80%.

• **Space work and ease**—The sp cabin at Marietta is 218 inches lo and 76 inches wide. Its height ran from 58 to 78 inches.

The front work area is divided i five compartments, each equipped w a chair and a control panel. The r rest area is equipped with bunks, ba room, small kitchen, a table and chai



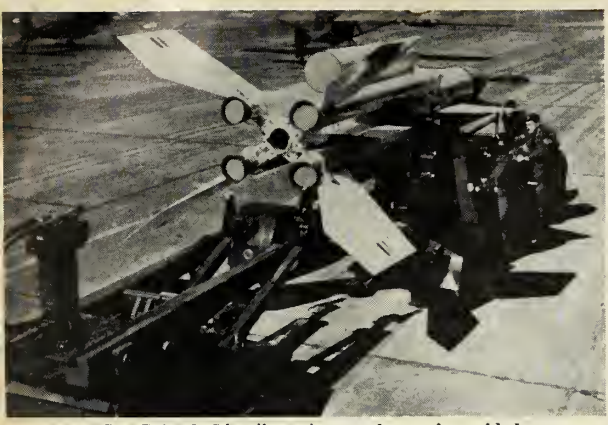
Occupants can be observed throu one-way mirrors and screens as well by closed-circuit TV cameras. El tronic equipment collects data on t occupants' heartbeat rates, breathi muscle tension and skin temperatur

The central panels provide sev tasks for crew members to accompl during work periods.

They must monitor three types scales and dials, solving mathemati problems, watching light patterns sir lar to radar and listening for a chan in an audio signal. Also, a series red lights must be turned off if th go on, and a series of green lights m be turned on if they go off.

Early experiments are expected concentrate on study of the work-r cycles. Crew members will not sleep the cabin but will bed down near Later experiments are expected to clude continuous confinement.

"This work-rest cycle will be a k thing in space," one scientist said. "T Navy's been working men four ho on and four off for generations. probably just superstition. But w knows? Maybe they're right."



COMPUTATION FOR THE SPACE AGE

PEDITIONS INTO SPACE FOLLOW TRAILS BLAZED BY COMPUTATION SPECIALISTS. IN THIS HIGHLY PHISTICATED TECHNOLOGY, BURROUGHS CORPORATION'S DEMONSTRATED COMPETENCE RANGES FROM SI RESEARCH THROUGH PRODUCTION TO FIELD SERVICE AS PROVED BY PROJECTS SUCH AS THE AIR RCE ATLAS. BURROUGHS CORPORATION IS EQUIPPED BY ABILITY AND ATTITUDE TO FUNCTION AS AN MEMBER—A CLEARCUT RECOGNITION THAT EVEN IN THE REACHES OF OUTER SPACE, THE SHORTEST TNCE BETWEEN TWO POINTS IS SINGLENESS OF PURPOSE APPLIED TO MUTUAL OBJECTIVES.

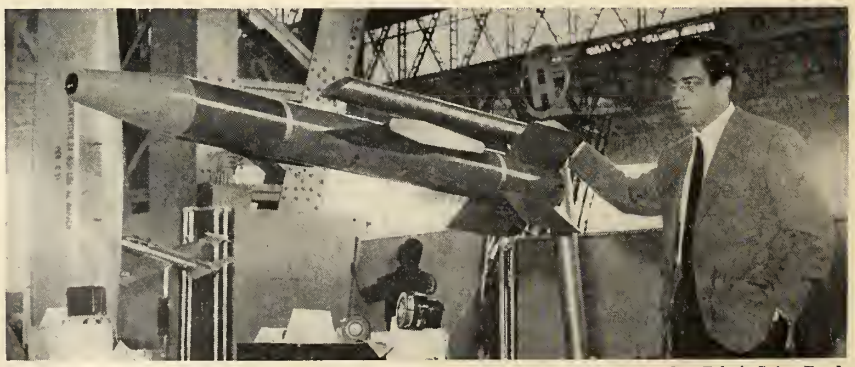
On Display at Paris Air Show

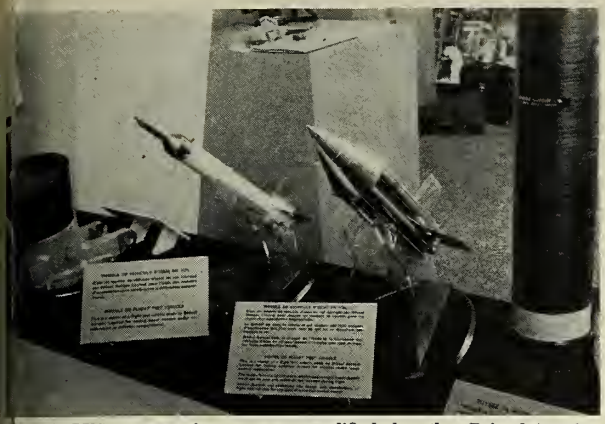
Pictures taken at the scene of the Continent's biggest Space Age exhibition

PARIS—British and American manufacturers vied with the French aircraft/missile industries at the 23rd Paris International Air Show—Europe's top international Space Age display.



The French, who led in sheer numbers of exhibits, are emphasizing production rather than prototype missiles, such as the Nord *SS-10/11* SSM's.

Although they appear to be prospering, French manufacturers are troubled by labor unrest and a shortage of orders. Some observers feel that the French aircraft/missile industry must cooperate closely with its counterparts elsewhere in Europe. The French market alone is not enough.



There has been considerable cooperation with the German and Italian industries, but cooperation with the British is regarded as the main key to broadening the scope of French manufacturers.

The British until recently showed little interest in wo ing with Continental aircraft/missile companies, except selling them license rights. But in recent months their tude has changed somewhat and they are now openly cussing how they can work with their continental ne bors to mutual advantage.

U.S. manufacturers, meantime, are increasingly in ested in the European market. The participation of Un Aircraft Corp., through its Pratt & Whitney subsidiary SNECMA activities is undoubtedly a sign of the times may well presage similar arrangements between other U and French companies.

POLARIS FBM

DISCOVERER SATELLITE

EXPANDING THE FRONTIERS OF SPACE TECHNOLOGY

■

ADVANCED PROJECTS AT LOCKHEED

DISCOVERER SATELLITE—Designed and built by Lockheed Missiles and Space Division, the first of a series of DISCOVERER satellite launchings was successfully placed in orbit on February 28. Later satellites in the series will carry live animals and their recovery attempted. Valuable data will be obtained on space environment and recovery techniques of major importance to the nation's space program. The DISCOVERER is an Advanced Research Projects Agency program under the direction of the Air Force Ballistic Missile Division, with Lockheed as systems manager.

POLARIS FBM—Lockheed is missile systems manager for the Navy POLARIS Fleet Ballistic Missile, under the cognizance of the Special Projects Office of the Bureau of Ordnance. Submarine-launched, the POLARIS will travel through three mediums in a single flight: water, air and outer space. With three-quarters of the earth's surface being water, practically no target in the world is outside its range. The solid-propellant POLARIS was *designed with the future in mind*—an approach that the Navy states has cut nearly two years from the original timetable.

Q-5, KINGFISHER—Developed for the Air Force, and currently being manufactured for the Army, the Kingfisher is designed to simulate enemy attacks to test the efficiency of our various defensive weapon systems. It is equipped with extensive instrumentation to register "kills" without itself being destroyed and can be recovered by parachute and landing spike to be used again, with marked savings in cost.

X-7—Lockheed's X-7 recoverable ramjet-engine test vehicle, developed for the Air Force, has established speed and altitude records for air-breathing vehicles and is also recoverable for re-use following flight.

X-17—The nation's first successful reentry tests were conducted by the Air Force with the three-stage, Lockheed X-17 solid-propellant ballistic missile. The X-17 has pioneered many new techniques and the valuable experience gained from this program has facilitated development of other, inter-service projects, including the Navy POLARIS FBM. The Navy's history-making, 300-mile-high, Project Argus radiation explosions featured the X-17 as the vehicle.

SPACE STATION—An orbiting research facility, to serve as an advance base for space exploration, has been proposed in practical detail by Lockheed's research and development staff. The station would carry a 10-man crew. Prefabricated compartments for the rim of the wheel, the spokes, and the three hubs would be launched separately by means of ballistic missiles and guided into a cluster on the same orbit.

The successful completion of projects such as these requires a bold and imaginative approach to entirely new environments. Lockheed's programs reach far into the future. It is a rewarding future which scientists and engineers of outstanding talent and inquiring mind are invited to share. Write: Research and Development Staff, F-29, 962 W. El Camino Real, Sunnyvale, California. U.S. citizenship required.

BRITISH ASTRONAUTICS

- *More successful Seaslug trials*
- *Rolls-Royce building Rocketdyne motors*
- *Thunderbird comes into service with Army*

by G. V. E. Thompson

LONDON—Sir W. G. Armstrong Whitworth Aircraft Ltd., makers of the Royal Navy's ship-to-air guided missile, *Seaslug*, announced recently that it has been so successful in recent trials with live warheads that there is now no need for it to hit every practice jet target.

During trials in Australia, three rounds with live warheads were fired against jet targets. The first two destroyed their targets; so the third was programmed to miss by a predetermined distance, in order to preserve the instrumentation in its target. This firing was also completely successful.

The *Seaslug* system is designed to destroy any enemy bomber which evades the fighter defences of the Fleet. It consists of a supersonic weapon fired from a multiple launcher mounted on a ship. The target is first tracked by radar; when required, a missile is fired from the command center in the ship. If necessary, missiles can be fired as a salvo. With long-range radar it can engage bombers up to the maximum height at which modern aircraft can fly.

To launch and accelerate the missile to supersonic speed, four solid-propellant boosters are used. These are located at the forward end in a wrap-around arrangement, and the nozzle of each boost is slightly offset so that the exhaust sweeps clear of the missile and also imparts a roll to reduce dispersion. Until arrival in the launcher, the boosts are in an unarmed condition and unaffected by shock loads. Loading into the launcher automatically actuates launching levers on each boost, completing the firing circuits.

The boost period lasts only a few seconds; toward the end of this phase the main sustainer motor is ignited. This is a high-performance solid-propellant motor. The high drag of the boosts then causes them to move rearward relative to the missile body and disengage. The flight control equipment is then operative.

Power for the guidance and control equipment is provided by burning isopropyl nitrate under controlled conditions to produce a gas supply. This is cooled, filtered and used to drive a turboalternator and a hydraulic oil pump. The turboalternator supplies power for such units as the guidance receiver (which is sealed and pressurized with dry nitrogen), roll st lization gyroscopes, acceleromet telemetry equipment, etc. The pump provides fluid pressure to m the control surfaces as directed by guidance system.

ROLLS-ROYCE rocket engine, similar to those to be tested at Spadeadam, developed for the *Blue Streak* LRBM.

Four wings are attached to sustainer motor section in a crucif layout, and there are four control faces fitted to the control ring in same planes as the wings. In addi to bringing the missile on course accordance with information from guidance receiver, the control sys is designed to limit manoeuvers avoid overstressing the airframe to maintain performance with va tion of speed and altitude.

In service, the missile is fitted v a proximity fuze. However, the v head may be replaced by a telem head which can monitor the flight formance through 24 or 48 chan as required.

External electrical and air supp to the missile enter at the boat of the missile, which also includes sustainer nozzle and electrical con equipment.

Four ships of the "Hampsh class of guided missile destroyer now under construction for the R Navy, and will be fitted with *Seas* The operational ship should be i range of not less than 5000-6000 t The total space requirement for system is 8000 square feet. *Sea* moves from magazine to launcher rails controlled by hydraulic hand gear; during movement it is war up, and cooling air is fed to the e tronic equipment.

It is power-rammed into the lau er, where final air and electrical c nections are made prior to firing. ship is fitted with search, tracking

FIRING OF Armstrong Whitworth *Seaslug* from H.M.S. Girdle Ness, the Royal Navy trial ship which has launched it hundreds of times.

ctrol radar. The firing crew is far ller than the crew of a gun turret n major warship.

A complete range of handling and kaging equipment is available and ady in use at store ships and land cots. It includes a special container able of taking the complete boosted sile and equipped with anti-vibra- and shock-proof mountings. Al- atively, the missile can be broken n into six major packages, each in pecial waterproof container.

The Royal Navy's trial ship, I.S. Girdle Ness, has carried out y trials with *Seaslug* over the last years. Several hundred missiles ae already been fired, and many air- t targets destroyed not only by mis- fitted with warheads, but also in ral cases by direct hits from *Sea- lug* with telemetry sections instead varheads.

• **Scoreboard**—Very low angle fir- have been successful. On more one occasion, when a salvo of rounds has been fired, with only ort interval between them, the first destroyed the target and the sec- hit the largest remaining piece of kage.

Transfer of the fully boosted mis- from ship-to-ship at sea has been satisfactorily. Special automatic equipment for ship installation per- all the functions of the missile to ested simply and quickly at peri- intervals.

In addition to Armstrong Whit- 's, the other principal contractors the General Electric Co. Ltd. of and, and the Sperry Gyroscope Ltd. Other firms participating are I. Ltd., Imperial Chemical Indus- Ltd., Vickers Armstrongs Ltd., McMichael Ltd.

• **Rolls-Royce builds Rocketdyne motors**—Rolls-Royce Ltd., of Derby, England, are building rocket motors for the *Blue Streak* LRBM. They have been adapted and re-designed by R-R from designs of the Rocketdyne division of North American Aviation, with whom R-R have a licence agreement. In tests which have been carried out at the U.K. Ministry of Supply Rocket Propulsion Department at Westcott, the design performance was fully realized.

Rolls-Royce now has about 250 workers at their new rocket motor and missile test center at Spadeadam, high on the Cumberland fells. When the build-up is complete there will be 500. R-R are managing this site on behalf of the Ministry of Supply.

• **Thunderbird**—The English Electric *Thunderbird* will be the first British-made missile system to come into service in the British Army. Two heavy anti-aircraft regiments are to be converted into guided weapon anti-aircraft regiments and equipped with this weapon by the end of 1960. The first begins its training in June at the School of Anti-Aircraft Artillery at Manorbier, Pembrokeshire, Wales.

In peacetime, the establishment of a *Thunderbird* regiment will be about 700 men. It will have two batteries, each with four missile launchers and a total of 44 vehicles and trailers. The two regiments will thus have only 16 missile launchers in all, which indicates that this missile is not to be introduced on a large scale, but is merely intended to give Army units experience.

Air defence of Army bases in Great Britain is the responsibility of the RAF, which is already equipped with the fully operational Bristol *Bloodhound* A.A. missile. *Thunderbird* will be operated by the Army in overseas theatres. It has been designed to form a mobile missile system which will move with the Army in the field and protect it from aerial attack. Even more important will be its task of attacking the enemy's reconnaissance aircraft, hindering the use of his ground-to-ground missiles.

The two batteries of a regiment can operate independently. In addition to the four missile launchers, each battery is equipped with a tactical-control radar, a tracking and illuminating radar, a battery command post, a launch control post, and facilities for assembling the missiles in the field and giving them simple checkout tests. This equipment is based on standard service vehicles, and can be transported by air (with the exception of the large tactical-control radar vehicle).

• **Homing**—Like *Bloodhound*, *Thunderbird* uses semi-active homing guidance. Both missiles utilize the British Thomson-Houston Co.'s Sting-Ray ground-operated target-illuminating radar. However, *Thunderbird* carries guidance equipment made by the Marconi Wireless Telegraph Co., whereas *Bloodhound's* is made by Ferranti, Ltd.

When in the field, early warning of enemy approach would be given by the RAF warning system. The target would be picked up by the tactical-control radar as soon as it was within range and information given to the Sting Ray target illuminating radar. When this was locked on to the target, missiles could be launched to home on radar reflections from the target. As there is only one Sting Ray per battery, each battery can only attack one target at a time. This is considered satisfactory at present, as reconnaissance aircraft normally operate singly.

Under development since 1950, *Thunderbird* was originally powered by a liquid-propellant sustainer, but now uses solid propellants. Cruciform fixed wings and pivoted tail surfaces are fixed to the body and there are four jettisonable solid-propellant boosters.

A more advanced Mk. 2 *Thunderbird* is under development, and will have a greater range and a guidance system less vulnerable to countermeasures. The Mk. 2 missile will probably be introduced in greater numbers, and it seems likely that batteries will then be provided with several target-illuminating radar sets, so that more than one target can be attacked simultaneously. This advanced *Thunderbird* may be used by the RAF as well as the Army.

Qualifications: B.S., M.S., or Ph.D. in Mathematics, Physics, Statistics, Engineering Science, or Electrical Engineering—and proven ability to assume important technical responsibilities in your sphere of interest.

SSIGNMENTS NOW OPEN INCLUDE . . .

MATHEMATICIAN: to handle mathematical analysis of advanced scientific computer programming for solution of systems problems, differential equations, probability-type problems, photogrammetry problems.

STATISTICIAN: to solve analysis-of-variance and multiple-regression type problems; to design experiments for various engineering applications and select form of statistical analysis of greatest value; to give statistical support to engineering departments in such areas as reliability analysis and human factors engineering by developing statistical programs for the IBM 704. Statistical experience in engineering problems and thorough knowledge of statistical distribution functions necessary.

RESEARCH MATHEMATICIAN: to investigate statistical problems in control system research on digital computer; to study control problems of analog to digital conversion, with particular reference to matrix problems; to apply experience with networks, statistics, or communications theory to problems in computer design; to solve problems involving switching theory, probability and information theory, and coding.

ATICS

APPLIED MATHEMATICIAN: to undertake assignments involving knowledge of feedback control theory, data systems theory, servomechanisms, information theory, statistical models, heat flow, circuitry, magnetics, probability.

MATHEMATICIAN-PROGRAMMER: to specify and program elements of a sophisticated automatic programming system. Must have considerable experience in automatic programming research.

OPERATIONAL PROGRAMMER: to develop computer program techniques for real-time military applications, using game theory and systems simulation.

OPERATIONS RESEARCH MATHEMATICIAN: to evaluate closed loop systems consisting of computers, radar displays, and inertial equipment; to simulate advanced weapons systems in order to evaluate alternate design concepts; to analyze and design electromechanical systems, studying targets, tactics, and operational effectiveness. Experience in applying advanced mathematical techniques to weapons systems analysis and evaluation. Knowledge of probability and linear programming techniques.

HUMAN TOLERANCE TO PROLONGED FORWARD AND BACKWARD ACCELERATION, N. P. Clarke and S. Bondurant, Aero Medical Laboratory, Wright Air Development Center, USAF, 34 pp., $1, available from OTS, U.S. Department of Commerce, Washington 25, D.C.

Astronauts will be uncomfortable, but able to endure the short spurts of high acceleration necessary to put them into orbit by three-stage rocket, according to this Air Force study of the best body positions for entry into space and return.

In tests on WADC's human centrifuge, some subjects were able to withstand forward accelerations of simulated three-stage rocket flights of 8, 10, and 12 g. Rates of onset acceleration were calculated to give orbital velocity—18,000 miles per hour—at the end of the third stage.

The centrifuge was set to speed up at a rate of 0.5 g a second to constant accelerations between 2 and 12 g. Acceleration was maintained until loss of a critical facility—vision, breathing ability, or impairment of judgment or performance by pain.

The best body position for forward acceleration appeared to be with the head and trunk tilted 25 degrees forward and legs sharply bent. In this position, no blackout was observed and subjects were able to endure 12 g for 5 seconds, 10 g for 23 seconds, 8 g for one minute, and 4 g for 15 minutes. Ten-g tolerance was limited by impaired vision and extreme difficulty in breathing.

Tolerance to backward acceleration, with legs bent and head and trunk erect, was limited by considerable discomfort from the restraint system, leg pain, and difficult breathing. Twelve g was tolerated for about 4 seconds and 10 g for about 12.

PREPARATION OF STANDARDS AND TEST PROCEDURES FOR PRINTED CIRCUITS, C. A. Dodge, S. E. Graf and W. W. Hansen, Stanford Research Institute for Wright Air Development Center, USAF, 119 pp, $2.50, available from OTS, U.S. Department of Commerce, Washington 25, D.C.

Research and development which led to the preparation of military specifications for multiple-contact printed circuit connectors are described in this report.

At the start of the program, questionnaires concerning the field performance of printed circuit connectors and terminations and laboratory testing techniques were distributed to commercial firms. Significantly, replies indicated that failure rate for connectors was below 1%.

The laboratory phase involved evaluation of samples of multiple-contact connectors suitable for use in printed circuit assemblies. Specification limits were derived from performance and incorporated in two tentative military specifications.

Where existing methods of testing connectors were not adequate, new, more suitable techniques were developed. Properties most important for printed circuit connectors were established.

Chairman Seeks Broad R&D Power

Rep. Overton Brooks feels his House group should have jurisdiction over all non-military research and development bills, and sees this as step toward Department of Science

by Erica M. Karr

WASHINGTON—A quiet but highly significant revolution going on almost unnoticed in the House of Representatives may alter the route of many government scientific research and development programs. In the middle is mild-mannered, soft-spoken Congressman Overton Brooks, Chairman of the House Committee on Science and Astronautics, who reports: "I'm pleased with the way things are moving."

Brooks claims for his committee jurisdiction over *all* bills involving non-military research and development. In Brooks' opinion it includes looking into such non-space areas as cancer cures or how to grow a better potato crop. He says House Resolution 580, setting up the permanent committee and spelling out its jurisdiction, gives the group full rein over such areas.

But this is in sharp variance with the opinion of the House Parliamentarian who has been assigning the committee only such R&D bills as are space-related.

The controversy grew out of the vague wording of the resolution, now part of House Rule II. After defining the specific agencies to come under the committee's legislative authority, the resolution wound up with the nebulously-worded item (G) which states in its entirety: "scientific research and development."

Most government agencies' R&D projects are blanketed within package legislation and assigned to the committee that handles bills for the specific agency. Brooks is now actively campaigning to get the agencies to separate their R&D requests. "We talking to the departments now, but will take a while," he declares. Sev major agencies and numerous smal ones are involved in R&D projects.

Neither the parliamentarian's offi nor Brooks will admit there is a basic difference of opinion, and nc space R&D bills continue to fl through the old, established comm tees. But Brooks is optimistic that shift is just a question of time.

• **Science department?**—The Hou Space chairman, as one of the pri drafters of the resolution, sees the evitably-broadened scope of his co mittee as the first move in establis ment of a Department of Science. is very important right now to establi such a department," he says. But wh bills setting up a Federal super scien agency are going through the Congr

THE HANDS IN THE POT

Altogether 23 government departments and executive offices are involved in some phase of our missile and space program. The network extends down from the President through his Science Advisory Committee, the National Security Council, National Aeronautics and Space Council, and Federal Council for Science and Technology.

Active agencies involved are the Department of Defense and its substructures and the civilian National Aeronautics and Space Administration.

The 16 supporting agencies and their functions in the space picture are:

1. State Department—Assistance in the promotion of international scientific relations, space control policies.

2. Treasury Department—Cooperation in areas of aeronautics and flight safety, recovery and rescue.

3. Agriculture Department—Basic and applied research in agricultural products and their use, new sources of food, use of chemical byproducts, nutrition.

4. Labor Department—Information concerning available technical manpower, location of same, trends as to size and composition of labor force.

5. Interior Department—Research into geological principles. Experimental programs on minerals and fuels, metals technology and metallurgy. Basic research on saline water conversion and water purification.

6. Commerce Department—Research and development in physical sciences; advisory to other government agencies on basic scientific and technical problems. Special weather services to the "active agencies"; basic research in climatology. Basic and applied research in geodesy, mapping, etc.

7. Health, Education and Welfare Department—Research and training in medical sciences, human behavior, and collation of such data on international scale. Evaluation of educational trends and needs, research into improved educational methods.

8. Inter-Departmental Committee Scientific Research and Development Promotes exchange of R&D informati particularly regarding government pers nel. Advisory on the administration government laboratories.

9. Federal Aviation Administration Aeronautical development and testi Research into flight safety and allied te niques.

10. Smithsonian Institution—Assistar in tracking of space vehicles. Basic search in space sciences, cosmology, c mogony, etc.

11. National Science Foundation Widespread basic research support throu grants, contracts, scholarships, inforr tion exchange, participation in continu International Geophysical Cooperat program.

12. Atomic Energy Commission—Ba and supporting research in the nucl sciences, including propulsion elements the space program.

13. United States Information Age

:onal mill, chances for their passage iis session seem slim.

When the science department does lcome a reality, the Louisiana Conessman feels, it should have jurisdicton over both military and civilian sace projects, representing a $5.5 bilIn annual government investment. 'cience is science whether it is milit'y or not," according to Brooks.

If and when military and civilian sace programs are merged, presumably t: Space Committee will be more tin willing to blanket in the military l:D as well.

Brooks is hardly awed at the prosp:t of biting off all of the civilian F:D measures as they funnel through t: House. "We're eager beavers," he s's. "We'll take it."

• **Lack of coordination**—One of Books' primary motives in wanting all F:D channeled through his committee ishis conviction that the importance o research to the national welfare has n: been properly assessed, and that as leg as it is the victim of a "bits and pces" approach, rather than a coordated effort, the United States area wl fall short of its potential in the tchnological race.

As an example he points to the lack o information on the country's acadnic and industrial scientific endeavo. "We should have a census of scie'e," he says, "to answer such questins as 'How many scientists are there ir each field? Where are they? What is th'r educational background, their exprience? Is the John Doe Company hrding scientists? Is scientific manpwer being used most effectively? Hw many future scientists will be gduated from the schools each year?'

We ought to devise some system so we can tell at any time.

"The National Science Foundation has done some work on this, but—for one thing—the little company gets overlooked. We had a representative of one small company testify before the committee that they spend $50,000 a year on research. How many others there are can just be a guess. We need to have a better idea of what the private companies are doing in the way of R&D."

The Budget Bureau estimates that research and development is financed roughly 50% by government, 50% by industry. The Ford Motor Co. alone, Brooks points out, spends between $20 million and $25 million annually on research. With the hodge-podge of country-wide research projects, and no one knowing what others are doing, there is bound to be "wastage in scientific ability," says Brooks.

Just how far companies would be willing to go to divulge the details of their scientific efforts in a public census is another question.

• **Goal 10%**—Brooks feels that while the government's gradual upstepping of R&D funds is a step in the right direction, a quickening of the pace is in order. "I don't think we are spending enough."

The Fiscal Year 1960 budget calls for a total R&D slice of slightly over 7%. Brooks would like to see it hit 10%, calling this "a good ratio." He feels it would be a good investment—"Adequate research will save the country money in the long run."

To help push the day closer, Brooks has introduced a "tithe for science" bill which would in effect add 10% for basic research to all R&D money measures.

Before this session of Congress is over, the House Space Committee has on its agenda, in addition to the research tithe bill, probes into the progress of the million-and-a-half-pound-thrust single-chamber engine and 6.2-million-pound clustered engine, development of the *Zeus* anti-missile missile, recovery of satellites and missiles and Federal scholarships for students majoring in oceanography, a field Brooks thinks could stand much more attention.

Congressman Brooks, now in his 23rd year in Congress, has spent 22 of them sitting on the Armed Services Committee, and was in on the beginning of the military's entry onto the space scene. His background of some of the complexities of the problems involved is, therefore, at least as good, if not better, than those of his colleagues on Capitol Hill.

His enthusiasm for the new field is perhaps even greater.

Vanguard Orbit Try Fails As Regulator Breaks Down

WASHINGTON—The ill-starred *Vanguard* project last week recorded its eighth failure in ten attempts to place a satellite into orbit.

The failure occurred in a second-stage pressure regulator, marking the fifth time that the vehicle's second stage has failed to function properly.

NASA scientists had hoped to launch into orbit a 22½-pound sphere that would have recorded the intensity of direct sunlight, sunlight reflected by the earth's cloud cover and show, and heat emitted by the earth.

The launching vehicle had been modified so that the payload and third stage parted on ground command after one full orbit.

The countdown was delayed two hours after the ignition system failed to operate on the first attempt. At 4:16 p.m. EDT Tuesday, the vehicle was finally launched, but NASA officials were not aware of the rocket's failure until two hours later when western U.S. tracking stations were unable to receive its signals.

The regulator, a stock factory item, allowed the rocket to come apart, keeping it from reaching the necessary 18,000 m.p.h.

• **Official word**—The NASA announcement said:

"The satellite did not respond to interrogation by the minitrack station at San Diego and therefore is presumed not in orbit. On the basis of data which have been received, it is indicated that there was some malfunction in the second stage. The exact nature of the difficulty will be determined from a further study of the data obtained."

This satellite, like *Explorer IV*, was launched towards the northeast from Cape Canaveral, which would have given it an orbit with about a 50 degree inclination from the equator.

Geomagnetic Equator To Be Measured by Ship

BERKELEY, CALIF.—Measurements of the earth's magnetic field are being made aboard the S.S. Mariposa with equipment from the University of California. The equipment will determine the amount of cosmic radiation reaching the earth along the ship's path.

Since the radiation is affected by the earth's magnetic field, an accurate picture of radiation intensity will provide data on geomagnetism. It is hoped that the experiment will locate the geomagnetic equator. It is the first of two or three voyages to be made in efforts to take readings of radiation over a portion of the earth's surface.

AF Sees Improved System Management

Weapon System Project Offices are reportedly getting the job done more efficiently, although there's still the problem of just when production people should take over

by Betty Oswald

WASHINGTON—Who manages the Air Force weapon systems programs? The answer to this question depends on whom you talk to. It's the source of much of the current confusion on Capitol Hill over the operation of the AF's Weapon System Concept. Congressmen frequently charge that AF has delegated its responsibility to the contractors.

This just isn't so, according to authorities on the weapon system at Wright-Patterson AFB. As explained by Maj. Gen. W. A. Davis, recently designated as Director of Procurement and Production at Air Materiel Command: "Air Force retains control of the weapon system program while at the same time giving the prime or associate contractor sufficient latitude to accomplish his job. In this role, the Air Force must time-phase and integrate all actions of AF agencies as well as those of industry.

"Because of the magnitude of the job and the limited technical resources within the Air Force, there was no alternative but to turn to industry for assistance in performing a portion of our task. The Air Force has retained overall decision-making management prerogatives for weapon system management." An earlier article pointed out that the key to AF management rests with the Weapon System Project Office.

Executive responsibility for management of the weapon system rests in the first instance with the little-known office of Systems Management at Wright-Patterson. Part of ARDC, it manages programs through their development phase and until a decision is reached to produce for inventory.

Activity of this office does not include the ballistic missiles which are handled by the Ballistic Missile Division at Inglewood, Calif.

• 40 systems covered—However, the job is not a small one. It oversees jointly with AMC's Aeronautical Systems Center about 40 Weapon Systems Project Offices including such programs as *Dyna-Soar,* advanced space projects, the *X-15,* the air-to-ground missiles, and the air-to-air missiles.

In addition, its responsibility includes the electronic support offices for such programs as Air Weapons Control System 212L, which General Electric is developing for use overseas.

As of now, the Systems Management Office is headed by Maj. Gen. Victor H. Haugem, who will soon report to the Pentagon as Director of Planning for the Deputy Chief of the Air Staff (Development).

Basically, the office is divided into six parts, each of which is headed by a deputy. Divisions are for: research vehicles and advanced systems, elec-

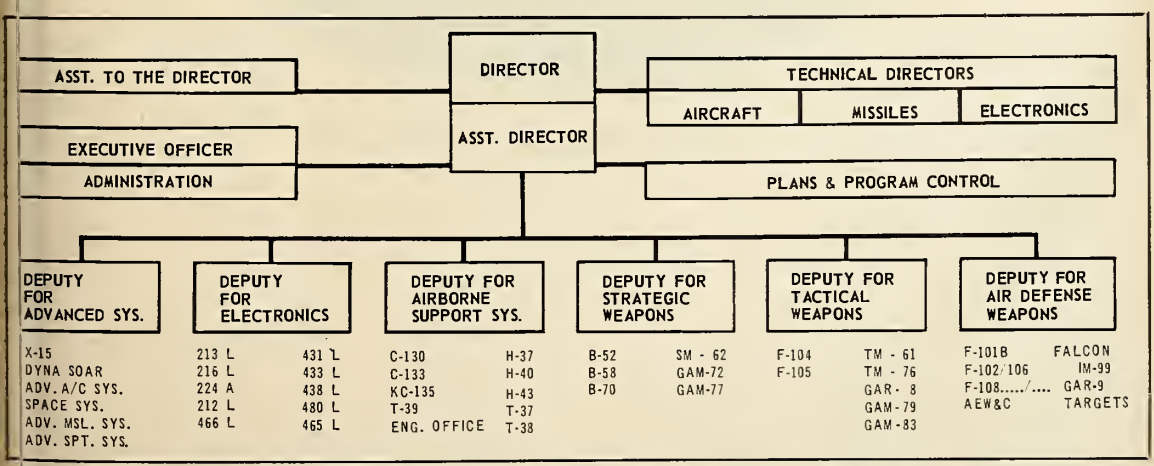

CHART of organization of the Air Force's Systems Management Office, a little-known but vital part of ARDC.

GLOBE-ILITY

Dawn in a
troubled harbor.
On the horizon,
units of a U. S. Navy
carrier task force.
Yesterday they were 700 miles away.
Today the lean ships and glinting jets are here to back up
U. S. policy. They came equipped to air-land Marines, win air
superiority, or trade nuclear blows.
Few bases are so formidable in so many ways.
None is better suited for guarding the
vast and scattered resources
which form the Free World's strength.

CHANCE VOUGHT
DALLAS, TEXAS

ADVANCED WEAPONS | ASTRONAUTICS | ASW | ELECTRONICS | MISSILES AIRCRAFT | G | RANGE SYSTEMS

500TH CRUSADER DELIVERED TO FLEET

The jet fighter that introduced 1,000-plus-mph speed to carrier decks is now with the Navy – 500 strong. Chance Vought *Crusaders* are deployed with the Sixth and Seventh Fleets as day fighters and photoplanes. Another *Crusader* version – the F8U-2N – is being armed and equipped for near-Mach 2 combat in darkness or bad weather. It will join the Fleet next year.

With the *Crusader's* dynamic design, Vought engineers broke down barriers that have stymied carrier aircraft performance. In the same way, the Navy has tuned U. S. carrier design to the changing requirements of defense. Since World War II, these floating bases have been improved 50% in all-weather operation, 100% in aviation fuel capacity and 200% in ammunition storage.

It was a supersonic step forward when these high-performance carriers were modified by the *Crusader*. The transition was completed at low risk and cost. And these fastest of all Navy fighters have since proved reliable, serviceable and economical, too, in long periods of foreign duty that have included Quemoy and Lebanon.

Design and production of high-performance aircraft make up part of the broad spectrum of Chance Vought fields of activity. Other areas include: advanced weapons, astronautics, electronics, anti-submarine warfare, range systems management, commercial process control systems.

CHANCE VOUGHT DALLAS, TEXAS

tronics, airborne support systems, strategic weapons, tactical weapons and air defense weapons.

Technical direction is provided by three civilian directors—one for missiles (everything except ballistic missiles), a second for aircraft and the third for electronics.

• **Step by step**—First step in the complicated process is the development of a general operational requirement for a specified weapon or support system. This is prepared by Headquarters USAF. The requirement is analyzed by ARDC which makes contracts with industry for design studies.

Based on an analysis of these studies, ARDC submits a development plan to headquarters for approval. Approval of this plan gives ARDC a Development Directive.

At this point, the partnership between ARDC and AMC is set up with the start of source selection processes. These procedures are spelled out in Air Force Regulation 80-3, dated April 28, 1959.

Under the rules as spelled out, ARDC, AMC and the using command meet jointly to establish a System Source Selection Board. ARDC assigns a senior officer to act as the nonvoting chairman of each board and direct the proceedings.

These Boards are used in two situations. They may be required to choose a group of contractors from industry to submit proposals, or they may evaluate specific proposals from contractors.

Rules provide that after the contractor briefings and other actions needed to acquire information, the Board completes its evaluation and presents it to the commanders of ARDC, AMC and the using command. Each commander then makes his recommendation in writing to the Vice Chief of Staff. In order to prevent leaks, references to selected contractors are by letter code only, with the code for the occasion identified by the senior board members.

Final decision is, of course, up to the AF Chief of Staff, Gen. Thomas D. White, and Air Secretary James Douglas.

• **Shifting responsibility**—After the contractor is selected, the Weapon System Project Office is organized and staffed by the Directorate of Systems Management and AMC's Aeronautical Systems Center. Executive management responsibility for weapon system integration is given the Directorate of Systems Management.

What "executive management responsibility" means in this sense is team leadership during the development phase of a weapon system. Systems Management Office is responsible during the entire design and development cycle until a final decision to produce is made. At this point, executive management responsibility shifts to the Aeronautical Systems Center. However, the directorate keeps its people in the Weapon System Project Office, since it continues to be responsible for production engineering proposals, the product improvement program, the making of technical fixes and for safety and grounding orders.

Tools used by the directorate during the development phase are development engineering inspections, known as DEI's and Mockups. These are used in an effort to insure the technical adequacy of the work of the contractor and the integration of subsystems. Emphasis on this part of the program has been increased sharply because of the necessity to push a program through without waiting for flight tests.

During the development cycle, Weapon System Phasing Group is headed by a representative of the Directorate. The group, which is not an action body, is designed to assure that each of the functional elements of the Air Force involved are apprised of problem areas and of the actions which must be taken by each functional unit to provide a fully operational weapon on schedule.

When Executive Management Responsibility shifts to AMC, chairmanship of this group shifts to the Aeronautical Systems Center. Perhaps the toughest job which now exists is to determine when this responsibility should shift. So far, the shift of responsibility has been decided by mutual agreement of ARDC and AMC. If the agreement isn't reached, responsibility remains with the ARDC group. This in turn leads to the charge frequently made that research and development people in their search for perfection often create the most perfect obsolete weapon.

• **Stubborn problem**—In general, however, reports from Dayton indicate that the program is now working better—that the jointly manned weapon system project offices are getting a job done, now that the system permits greater action. Nevertheless, it is seemingly agreed that the really hard problem hasn't been solved yet. Simply stated, this is: "When does a weapon move out of its test and development phase to a point where production people should take over?"

The corollary problem is: "How much of a slow-up occurs production-wise as a result of the shift of executive management responsibility from one agency to another?" The answer to this last question depends entirely on how closely ARDC and AMC officers have been working together in the Weapon System Project Office.

$30 Billion Defense Spending Boost Urged

To put the United States on a par with Russia militarily, the Democratic Party's Advisory Committee says the nation must spend an extra $30 billion over the next four years—mostly on missiles. The committee charges that the country's defenses presently are in "disastrous" shape.

The committee recommends: doubling planned and actual rate of production of *Atlas* and *Titan;* stop-gap development of *Snark* and *Regulus II;* speed-up *Polaris* and *Minuteman;* continue high priority of *Nike-Zeus* development; give SAC 24-hour airborne capability; and increase jet tanker production.

Hits and Misses

A **Martin** *Bold Orion* two-stage ALBM prototype—the 11th—was fired successfully June 19 from a B-47 over Cape Canaveral. Rocket was programmed to travel several hundred miles . . . At Vandenberg AFB, a Royal Air Force crew launched a **Douglas** *Thor* June 16 and the missile had to be destroyed seconds after lift-off because of a "mechanical malfunction."

A supplemental appropriation of $485.3 million has been requested for NASA by President Eisenhower. The money bill follows an authorization for that amount already signed into law.

Waste of $1.4 million through a "lack of foresight and faulty planning" is the Senate Preparedness Subcommittee label hung on the Navy's decision to close down a new *Terrier* missile depot in Boston Harbor. Said the subcommittee: "Obviously it is not good business to construct a modern missile facility and then turn around and close it down. It is no wonder that the cost of national defense rises . . ."

Titan Base Contract

Ralph M. Parsons Co. has the $767,000 A&E contract to design a new $84 million *Titan* installation at Larson AFB, Wash.

The Martin Co. has set up an "activation division" under Vernon Rawlings to act as integrating contractor for construction and activation of *Titan* weapon systems in the field. The first job will be at Vandenberg, and will be under the direction of BMD.

OCBM has granted fast tax write certificates on 65% of $1.2 million **Lockheed** for missile R&D work Van Nuys, Sunnyvale, and Santa Cr to **Thiokol** on 60% of $600,000 rocket engine R&D at Denville, N and to **Boeing** on 75% of $1.5 mill for missile and space vehicle R&D.

Black Paint Job For *X-15* Re-entry

Jet-black, silicone-based paint us on **North American's** *X-15* resear plane, designed to withstand re-en temperatures in excess of 1000°F, expected to last through four or fi flights.

Ryan Aeronautical Co., now bla forming metal parts in an outdoor at San Diego, is building a new exp sive forming machine that will rese ble a deep diving bell. If it tests out expected, the next step will be pr duction-type equipment for operati in the factory, perhaps in a year two.

The Changing Scene

Acoustica Associates Inc., whi had 3 employes four years ago, h opened its fifth plant—a 50,000 squa foot building devoted exclusively to trasonics at Plainview, L.I. The co pany now has 425 employes . . . A n liquid epoxy resins plant with a 15 m lion pound annual capacity has be put on stream at Marietta, Ohio, **Union Carbide Plastic Co.** . . . In diversification move, **General Dynami** has acquired the 17 plants of **LaVer W. Hench & Associates** for "sever million dollars." The plants produci oxygen, hydrogen, argon and oth gases will be operated by GD's Liqu Carbonic Division . . . **Raytheon In** is building a new plant at Portsmout R.I., for its Navy ASW operation . . **Magma Products** of Santa Fe Spring Calif., has sold a 51% interest **Thompson Ramo Wooldridge.** Magn makes specialty chemical and electron products and holds an ARPA contrac . . . **Dynatronics** is moving to a ne plant at Orlando . . . Step-up in th hiring rate of all types of employes underway at the **Sperry Semiconducto Division** of **Sperry Rand** in Norwal Conn., as part of an accelerated e pansion program . . . **Dynamic Gear** building a $200,000 plant at Amit ville, N.Y. . . . and a plant with 28,0 square feet of space is under constru tion by the **Autonetics Division Nort American Aviation** at Downey, Calif for an environmental test laboratory.

Von Braun spoke on "Education in the Space Age."

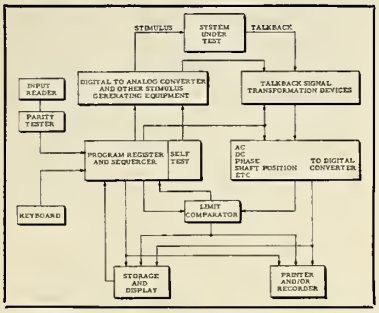
Big Push for Automatic Checkout

Fully transistorized systems are rapidly being developed—one is operational

by Charles D. LaFond

WASHINGTON—The big push is on ndustry to develop solid-state auto- ic checkout systems. The stagger- complexity and the vast number of erent missile weapon systems de- oped in recent years has spawned an ost equally large array of auto- ic checkout systems.

The initial testing, pre-launch or -flight testing of weapon systems forced the use of radically new hods and techniques, particularly ause of the constantly increasing d for greater speed and near 100% ability.



As a result of this increased com- xity, it is no longer feasible in view time, expense, and personnel train- problems to use highly skilled kers to perform the tests, evalua- , and adjustment of sub-systems systems. The need for completely omatic checkout devices and pro- ures was obvious several years ago , as a result, progress and develop- nt have been rapid. We are now in hase of transistorizing most of the re checkout systems.

Solid-state switching devices have hed a point where it is now practi- to design and construct completely matic checkout systems with much ter reliabilities. The new systems be considerably more flexible, rate at higher speeds, and provide er performance. Finally, mainte- ce will be faster and greatly simpli- because of the use of decks of ted circuit cards, overall modular struction and vastly improved self- king features.

An M/R survey of many of the ntry's leading producers of success- checkout systems has indicated the owing:

• Conventional systems for many lications certainly will not be made olescent by the higher speed tran- rized systems in development.

• Those manufacturers taking the e expedient course in developing conventional checkout systems now have an operational capability.

BLOCK DIAGRAM of a generalized solid-state automatic checkout system.

• Almost all manufacturers paralleled conventional systems development with an R&D effort at their own expense to design fully transistorized systems. To date, M/R has found only one—by Curtiss-Wright Corporation—that is operational. Others have developed prototypes and in some cases the military has proffered contracts to marry systems to missiles and aircraft.

• There exists an urgent need for a government requirement for designing future missile systems to accept automatic testing. The burden should not rest solely with designers of automatic checkout systems. (It should be noted that the cost of matching specialized individual test units with a weapon system is approximately 15 times that of automatic universal-type systems.)

• There also exists an urgent need for government standardization of automatic test procedures.

• Greatest stumbling block in developing very high-speed transistorized checkout systems has been in the state-of-the-art levels of the various major sub systems—computer technology is vastly more advanced than other units. In particular, one problem area has been the transient reaction time associated with switching matrices. In computerizing high-speed testing, the system must have high-speed programmable devices. Another thorn has been the access problem to meters—that is, the ranging and scaling by pulses in both stimulation and test equipments. Finally, development of a satisfactory programmable power supply has been slow.

• As might be expected, checkout system development has followed a pattern of self-standardization in general design and in functional subsystems. Real variance occurs in unit configurations only with final application.

• **Generalized system**—In general, information governing automatic test procedures is provided by paper or magnetic tapes, from punch cards or is manually directed into some kind of program register and sequencer. Some checkout systems use a supplementary wired patch board panel; with others, the patch board provides complete direction. To insure proper functioning of the primary information input, some type of parity check is made.

Information normally is stored to indicate not only the nature of the tests to be performed but certain tolerance limits of the response. A control of the timing sequence to perform various tests often is included. A central gating system frequently is provided to insure that tests are conducted in a sequence that cannot damage or destroy the system under test.

Finally, certain self-test procedures are included to check the operation of the checkout system itself. This usually includes some kind of a cutoff device which will stop the sequence of tests in case of a checkout-system failure until such time that the defective unit (or units) has been corrected.

Next week: the fully transistorized automatic checkout system developed by Curtiss-Wright Corp. will be presented. Its application to a Nike *system will be explored in detail.*

Input signals to the system under test are generated in several ways. A digital-to-analog converter is used to transform a digital value in a program register into either an ac or a dc voltage. At times, special signals, peculiar to the system under test, must be generated. At this time, the program register may be used to direct the appropriate signal. After feeding various stimuli into the system under test, response may have to be transformed before being converted into digital values.

Transducer outputs may require corrections for nonlinearities. Following this, a series of converters is used to convert the system response into digital form. These values can then be compared to the limit values in the program register and results can be displayed visually and printed.

Many systems also incorporate a manually operated phase. When in the manual mode of operation, the programming tape is not employed. This gives the system considerably more flexibility and enables it to be used in different phases of development or production in a missile weapon system program.

In most automatic checkout devices, there is of necessity a similarity in functional subsystems. To better understand how the typical checkout device is constructed, major subsystems are described below.

• Programmer—The programmer is the central element of a checkout system, providing storage for the various parameters and control information characterizing the test procedure. Information concerning one or a number of steps may be stored at one time. A large number of techniques for storing information are employed: transistorized flip flops, magnetic cores, magnetostrictive lines, or a combination of storage media may be appropriate.

• Stimulus generators—A multitude of stimulus-generating equipment may be employed, according to the nature of the tests being performed. In general, the application of stimuli, as indicated earlier, is directed by the programmer. Typical generators might be high-frequency units with various types of modulators, mechanical stimuli motors, temperature controlling equipment, pressure generators, rate and acceleration generators, etc.

• Signal transformers—The talkback signals often must be transformed before conversion to digital form. Transducer outputs, for example, may need to be amplified and linearized before conversion. Some r-f and power measurements may require an intermediate conversion before digital information can be derived.

• Analog-to-digital converters—As already indicated, analog-to-digital converters are provided. In addition, other types of converters must be used to convert to digital form the position of servos and synchros. Both mechanical and photoelectric encoders may be used.

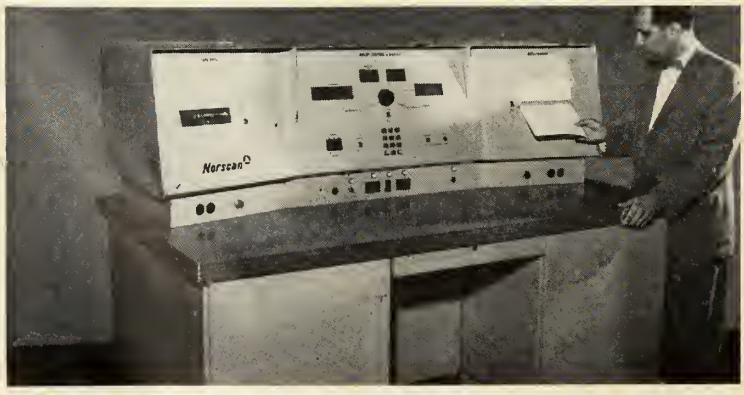
• Comparators—Many means are available for comparing the magnitude of two digital numbers. One method is to scan the two numbers from the most significant end and note the first position in which the two differ. The number that has a one in that position is the larger but this assumes certain sign conventions.

Probably the most frequently used logic system is the method of subtracting one number from the other and observing the sign of the difference. The advantage of this method is the yield of the magnitude of the difference which may be necessary for display or recording.

In checking limits, both the upper and lower must be compared. The two operations can be performed sequentially by one device or simultaneously by separate converters. For very high speeds, completely parallel systems may be employed.

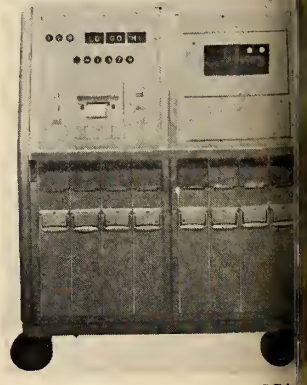
• Readout or display—Readout of checkout system can be in one or both of two forms, temporary or short term. Readout may be by warning lights, numerical display, or audible alarm. It may be permanent—such as printed tape, punched card or tape, or magnetic tape.

• Printer and/or recorder—A permanent record of the tests is normally required for future reference and further analysis. This calls for use of printers or recorders.



• Storage unit—If information is to be displayed and held at each step, or if it must be printed and recorded, some form of intermediate storage is necessary. Solid-state flip flops together with power amplifiers (required to activate displays) can be used for this purpose.

• Solid-state design—In the current state-of-the-art, almost all of the various checkout equipments described can be constructed using only solid-state active elements. There are a few exceptions, such as the r-f generators and talkback transformation devices.



In designing the checkout system with solid-state components, the use of mechanical devices is minimized as much as possible. For example, dc amplifiers employ silicon transistors rather than mechanical devices for stabilization. In general, there is an optional use of either silicon or germanium transistors depending on the temperature requirements in the system. Magnetic elements such as shift registers and coincident current memories can be used, and magnetic regulation is employed in the system power supplies.

Packard-Bell Electronics Corporation, Los Angeles, has been designing and developing a number of units

Typical Fully Transistorized Checkout Systems

NORTHROP CORP., Nortronics, fully transistorized Norscan console (without stimuli-generating equipment) now in prototype form.

STROMBERG-CARLSON SCA using flexible functional module

eckout systems. In their design phi-ophy, they use etched circuitry as tensively as possible. In addition, ty employ the largest possible odules consistent with etched circuit thniques and with minimal spare part ventory requirements. Their reason: provides a significant increase in re-bility by minimizing the need for ring between boards. They also em-oy etched bus-board for interboard ring to eliminate individual wires.

Another problem area eliminated Packard-Bell is the use of positive tact connectors. For each module uiring individual interboard wiring, nnections are made physically and ctrically to the etched circuit, thus minating faulty contact difficulties en associated with etched board con-uction.

• **Trend index**—Along with the de-opment of solid-state checkout sys-ms, new concepts for the use of these vices are being incorporated. Curtiss-right Corporation of Santa Barbara, Calif., with their now-operational *Nike*-stem checkout equipment, and Nor-nics of Hawthorne Calif., with its ototype Norscan system, are both ilizing a "trend" or "confidence" ex. Employed in a similar manner, t idea is a step beyond that of more ntemporary go-no go type testing.

Nortronics has described its con-fence index as follows: The test read-t that is made is compared not only ainst established no-go limits but is ighed in relation with the reading de just prior to it. For example: uld a low voltage be fed into an plifier which doubles the voltage plitude, the comparative limits of t amplifier output are adjusted to npensate for the low input per-tting the amplifier gain to be on the h side, with a resulting acceptance o the two units because the summed ult is within the design limits. This comparison in Norscan will be accomplished by a processor which makes the necessary arithmetic computation.

If a no-go reading is obtained, the test equipment goes into a hold configuration and isolates the malfunction in the system under test to the next-lower level. If isolation to a still lower level is desired, it may be accomplished by using a mode selection capability incorporated in the test set. In this case, the operator can remove the subsystem causing the problem, connect into the test equipment individually, and perform more specific tests, or a different set of tests for that particular subsystem.

If a go indication is received, readout indicates to the operator just how good the go signal was. This data is provided in the form of a two-decimal digit presentation reading from 99 to zero.

In the initial phases of any developmental program, the system designer must establish the design center he is trying to achieve. He then arbitrarily establishes no-go limits. Until the test program has proven what these limits actually should be, the trend or confidence index is a means of utilizing past experience to indicate that a particular reading does or does not have too much effect on the accuracy or reliability of a particular system.

• **Exact limits**—The final values used in an index of this kind are derived by simulating a system in a computer (such as the IBM 704) and then by varying the parameters that are to be tested to determine their effect on the overall system. By this means, exact design limits can be established and variation effects of these parameters can be determined.

Each parameter is assigned a weighing factor. Then, as the system is tested and data recorded, a weighing factor is assigned to each one of the reading. Following the tests, a summation is made of all test limits with their weighing factor resulting in the two-decimal digit presentation.

Another important part of the original derivation of values in the index is the separate determination of values for reliability, accuracy and safety. These may be presented as three separate readings or may be combined in one overall index number.

• **Reliability**—Link Aviation Inc. of Binghamton, N.Y., believes that each specific system must be analyzed in detail before an intelligent definition of the checkout requirements can be specified. In general, design of any automatic checkout system requires primary compliance with system reliability as well as the fundamental concept of inherent versatility.

Systems must not only be simplified to permit maximum utilization by semi-skilled or unskilled personnel, but they must be capable of performing all tests necessary for the checkout of the system of subsystem and the various components in the subsystem. Thus the company believes that the more contemporary go-no go type checkout gear best meets these requirements.

But Link has indicated also that means should be provided for the generation of additional programs which may prove to be necessary. These would be performed by operators at the engineering level. With respect to reliability of the check out equipment, of necessity, it must be considerably better than that of the equipment under test. Link has stated the following requisites to be obtained with such high reliability:

1) System self-check should be accomplished as a requisite to any system test and should be executed from the most straightforward manner possible. The capability should be such that the self-check could be made by depressing a push button any time and without replacement of the tape or cards being used at the moment.

2) Redundancy bit checking should be included in the design of any checkout system in the manner which will interrupt the test routine when a discrepancy in coded signals is detected. Audible and visual alarms should be activated at the same time to provide suitable indication to the operator.

3) In some systems where considerable hazard is likely from the generation of faulty commands or where a dangerous situation can result from component failure in the checkout equipment, a policy of permissive progress should be employed. This requires the testing equipment to generate signals indicating successful completion of each command before the next information can be read and acted on.

RTH AMERICAN AVIATION, Autonetics, fully transistorized type GS-1 (C2-4A) includes simulation equipment. It is now in production.

Space Observatory in Three Years

NASA is spending $3.5 million to solve the remaining problems and bring a revolution in astronomy; 1.5 million pound thrust engine clusters are believed adequate

by Hal Gettings

WASHINGTON—Today's space research programs offer a golden opportunity to astronomy. We can now foresee—possibly within three years, according to Dr. Leo Goldberg, of the University of Michigan—astronomical telescopes on satellites orbiting the earth.

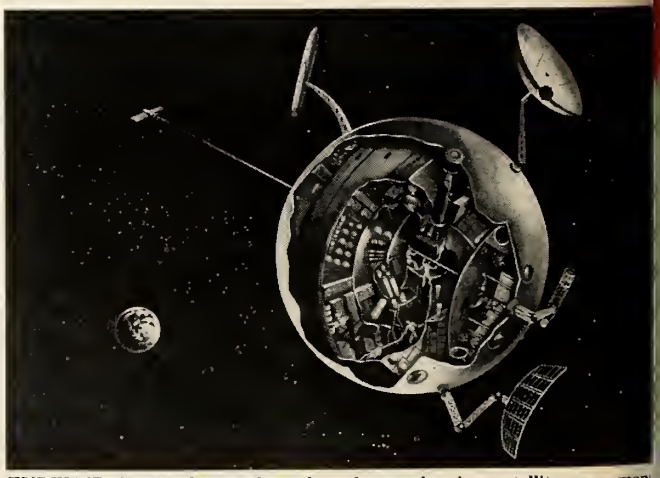
Eugene Root, Lockheed Aircraft, has predicted that during the next decade "astronomical observations from space vehicles will be an accomplished fact (and) will revolutionize conventional astronomy." He indicated that future astronomical techniques may bring the answer to the evolution of the universe.

According to Prof. Lovell, the British astronomer, satellite-borne radio telescopes will be able to look back billions of years to obtain information on the state of the universe as it existed then.

The earth's atmosphere and ionosphere act as a screen to most of the electromagnetic spectrum of radiation from celestial bodies. The establishment of space observatories will put man on the other side of this curtain —and reveal many of the secrets of the universe hidden from him today.

Artificial satellites and planets make possible a whole series of experiments and observations which are unique and lead to tests of the very foundations of physical theories. Space research introduces the element of controlled experimentation into what has always been fundamentally an observational science.

Much work has already been done; much remains to be done if the proposed three-year schedule is to be met.



• **Step number one**—The first step has been taken with the spectroscopic photography of the sun's radiation in the light of Lyman—a line of hydrogen. This was done by a rocket camera fired to an altitude of 123 miles. A technique has also been developed to scan a selected spectrum and telemeter the observed intensities back to earth—a method leading itself to satellite observation. Work is currently being done on development of 8-inch and larger telescopes with necessary television equipment to transmit observations to ground stations.

Approximately $3.5 million has been budgeted by NASA for study and development of problems directly concerned with astronomical satell (performance requirements, protot telescopes, command-control and d handling and transmission, vehicle sign and construction).

• **Problems**—Many problems m be solved before successful space servatories can be established. Pr ably the major one is a vehicle capa of placing a payload of several th sand pounds in orbit. It is expec that the 1.5 million-pound thrust gine clusters now under developm and scheduled within the next t years can do the job.

A host of instrumentation proble must be solved before the observat becomes a reality.

The satellite telescope must only be stabilized so that it will pc

FURTHER in the future than the telescope-bearing satellites are man observatories like this 250,000-pound vehicle envisioned by Rocketdyne ar

curately in any desired direction in ace; the direction of pointing must o be controllable from the ground.

An adequate power supply must be ovided with reasonable long lifetime. e technique of using solar cells has en notably successful in the case of *nguard 1.* The same technique could used on an expanded scale to pro- ce 10-20 watts of power, which uld be satisfactory at present. Radio- ive sources and chemical fuel cells o offer promise.

Most of the problems connected h the storage of data and its trans- sion to earth have already been ved to an extent with earlier rocket l satellite experiments.

There still remains the extremely icult problem of designing optical tems and detectors that will operate h high efficiency for radiation of y short wave length.

• **Experiments**—The Space Science ard of the National Academy of ences and its ad hoc committees e been working to prepare an out- of what seem to be, at present, most important space experiments. y are aware, of course, that it is realistic nor even possible to list the many exciting astronomical ex- ments that could be performed n space vehicles. According to Dr. dberg, chairman of the Astronomy Radio Astronomy Committee, this ine is intended only to point out possibilities to potential investiga- who may realize the very great dity with which space technology dvancing.

• **The sun**—The sun is certainly an ct of very high priority for study. the only star whose detailed sur- features can be studied and its tion has a very direct and prac- influence upon our daily lives. Every advance made towards the understanding of the sun serves also to expand our knowledge of the other stars. Although a vast amount of knowledge has been accumulated about the sun, many of the most fundamental questions concerning its structure and activity are completely unanswered. Our knowledge is most deficient with respect to the outermost layers, the chromosphere and corona, both as regards the structure of these layers and the nature and origin of the often catastrophic disturbances that take place within them.

Many interesting experiments are being planned for the observation of X-rays and ultraviolet radiation from the sun. Perhaps the most urgent is the reconnaissance of the spectrum with scanning spectrometers. This experiment need not await the development of refined stabilization techniques since a great deal can be learned from analysis of radiation averaged over the whole disc of the sun. As soon as accurate pointing capability is acquired, small regions on the surface can be isolated for more detailed studies.

A second series of experiments would involve recording images of the entire sun in monochromatic radiation at ultraviolet and X-ray wavelengths. Similar monochromatic photographs made in visible light from the ground have already constituted a major source of information, particularly with respect to the transient disturbances.

An interesting byproduct of the solar spectrum studies would be the determination of the densities of the constituent atoms at altitudes above 200 kilometers in the earth's atmosphere.

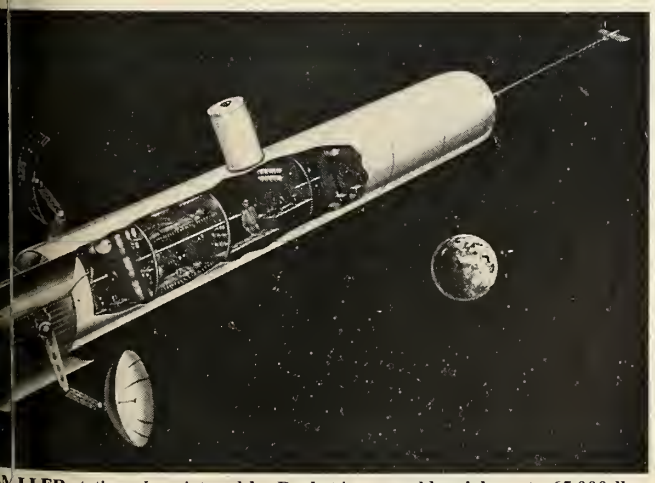
The observation of radio waves at frequencies below about 20 mc, which are reflected back into space by the earth's ionosphere, are also of interest. Particular importance is attached to the solar radio bursts in the very low frequencies. The dynamic spectra of these bursts, which originate high up in the chromosphere and in the corona, have been observed to a low-frequency limit of 40 mc. The so-called type II and type III bursts, which begin at high frequencies and occur progressively later at the lower, have been interpreted as resulting from corpuscular streams propagated outward through the solar atmosphere at speeds varying from a few hundred to a few tens of thousands of kilometers per second.

• **Moon and planets**—Investigations of the moon and planets will be carried out with space probes and by actual exploration. The moon will be the first object for investigation, and the next few years will probably see a variety of experiments including:

1) Return of lunar surface samples to earth.

2) Measurement of density and composition of possible lunar atmosphere.

3) Study of composition and structure of surface and interior of the moon.



4) Measurement of lunar magnetic fields.

5) Investigation of presence or absence of dormant life spores.

The planets may also be explored from satellites and space probes with packages of instruments to obtain pictures with different wave lengths of radiation and for the detection of numerous phenomena such as magnetic fields, planetary ionospheres, lighting flashes, aurorae, etc. It has also been proposed that radar pulse probes be used to display the surface roughness of planets.

The success of many of the planetary probe experiments will depend rather critically on the amount of power available for the transmission of information back to earth. For example, it would be useless to send a space probe close to Mars to televise its surface unless the resolving power of the image received is smaller than about 25 miles; otherwise just as good or better results can be achieved with a 50-inch telescope mounted in a high-altitude balloon.

In the very immediate future the most profitable investigations of planets from the vicinity of the earth will probably be carried out by balloons rather than satellites. Considerable work in this area is continuing under Office of Naval Research projects "Stratoscope," "Skyhook," and "Stratolab." Commander Malcolm Ross, with Dr. Strong of the University of Maryland,

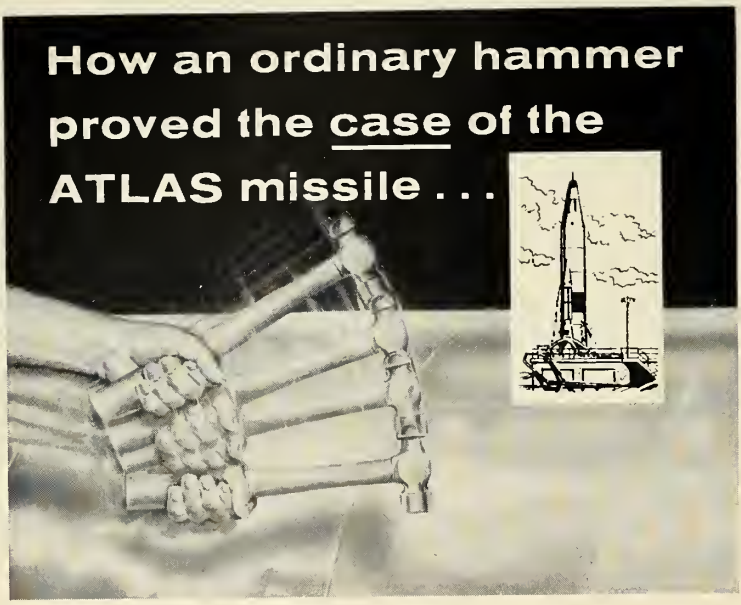
LLER station also pictured by Rocketdyne would weigh up to 65,000 lbs., ering a launching booster vehicle with about 6 million pounds of thrust.

feels that much more can be done with this program and that balloons should be used for all observatory work below 150,000 feet. As in many other programs, money has been the limiting factor.

• **Stars and nebulae**—Satellite investigations of the stars, nebulae, and interstellar medium and external galaxies are at least an order of magnitude more difficult experimentally than those dealing with the sun, because of the relative faintness of the sources and the stringent requirements for accurate guidance and control. Furthermore, astrophysical measurements from rockets have to date been limited almost entirely to solar spectroscopy and, therefore, the galactic experiments are not so well defined as the solar experiments. For these reasons, galactic and extra-galactic research from satellites will probably proceed in two stages. It is extremely important as a first step that the ultraviolet radiation from night sky be mapped quickly, even relatively low angular and spectral olutions. A start has already been n with rockets by the Naval Rese Laboratory.

A number of astronomers proposed experiments for compre sive sky surveys designed to yield m urements of the radiation density number of wave lengths and with ing degrees of angular and spe scopic resolution. If the wave len are properly chosen, valuable infor tion can be obtained on the phy state of interstellar matter, on the u violet energy distribution of bright, stars, and on the relative contribut to the integrated radiation backgr of starlight, galactic light, extra-gal nebulae and zodiacal light.

After the sky surveys, the next s of galactic investigation would c with the establishment of accur controlled telescopes in satellites has been estimated that it will be sible within three years to mou telescope on a stabilized platform sufficient control and pointing accu to permit the imaging of indivi stars. Two groups are already at w on the design and development such telescopes.



The first few years of sate astronomy will probably be devote the astrophysical analysis of ultrav radiation. This is an area where loons cannot be used since the u violet frequencies are absorbed ozone and photochemical reactions low 150,000 feet.

As the technology of instrume tion advances, it may be expected there will be important application the field of astronometry—the pre measurement of the positions and tions of the stars.

• **Solutions**—Three sources of nificant systematic errors would eliminated by a telescope mou above the atmosphere: imperfect tr parency and seeing and atmosph dispersion. Images would be sm and fainter stars would be reached. additional great advantage would the attainment of high optical resol power in the ultraviolet. Condit would be particularly favorable for serving faint white dwarf stars, whe single or components of binary st

A survey for binary stars am "single" stars would be more p trating than from the bottom of atmosphere. In particular, it shoul easier to discover faint companion s and possible planetary compani The possibility of discovering m faint red dwarf stars would also enhanced in the absence of atmosph absorption in the red and infr regions of the spectrum.

How an ordinary hammer proved the case of the ATLAS missile . . .

The body of the missile, essentially one big fuel tank, is similar in principle to an inflated football. Convair-Astronautics broke new ground in missile design by developing a super-strong structure with a comparatively thin stainless steel skin to keep weight to a minimum. This stainless steel skin is so thin that the interior has to be pressurized to preserve the shape of the body as propellants are consumed in flight, or when the missile is being transported on the ground.

Some critics, however, thought the body was too fragile—"You could dent it with a hammer." So, recently, when the Scientific Advisory Board, engaged in a re-evaluation of all missile programs, arrived at Convair-Astronautics to take a reading on the ATLAS, they found that Convair had thoughtfully placed a number of hammers within easy reach of a finished missile. "Go ahead, bash it," invited Convair. The SAB members swung lustily. *Not a dent was registered*, for, although the walls are thin, the stainless has a minimum tensile strength of 200,000 psi.

This stainless steel skin material, supplied by Washington Steel, required extremely close control of mechanical properties and gauge tolerance which are regularly produced through Washington Steel's long experience with precision rolling equipment.

Report from West Germany

The following dispatches were sent m West Germany by M/R's executive tor, now touring Europe.

by Clarke Newlon

RAMSTEIN, GERMANY, Hq. 4th Allied ctical Air Force—Russia has "hun- ds" of 700-mile ballistic missiles facing stern Europe, according to intelligence orts which reach Maj. Gen. Gabriel llon Disosway, commander here. They not in the satellite nations but are bile, some of them poised on rail cars, l can be moved at a moment's notice.

These are in addition to IL-10 Beast ck planes, Mig 15s, 17s, and 19s, 28 jet bombers and Yak-25 all-weather rceptors. The planes are all missile riers, and although the IL-28 poses the atest strategic atomic threat, nearly all st be assumed to be nuclear-capable— are the ballistic missiles.

Facing some 3000 Soviet and satellite mbat aircraft, Gen. Disosway, a native Pomona, Calif., has 1500 U.S. and nch combat planes, but figures those s are not too great. Also under his op- tional direction is a brigade of *Nike- rcules* air defense missiles operated by Army, but carefully coordinated under 4th ATAF defense plan. Air bases at hn, Bitberg and Sembach have the -mile air-breathing, nuclear warhead rtin *Matador* at the present but will n change over to the more modern *ce,* which requires no ground guidance.

Russian and satellite ground forces are pped with 20-mile air-breathing mis- . All in all the West faces a Soviet at of probably 20,000 combat air- t (150 heavy bombers, 1000 medium mbers and the rest fighter planes) plus divisions of ground forces, plus also tever longer-range missiles Russia may e. It takes, incidentally, about 15 min- for a Soviet bomber to reach Ram- from the edge of the Iron Curtain.

Contrary to published reports, Gen. sway did not say that the U.S. nned" to move three U.S. fighter bases France (Etain, Toul and Chaumont) use the French would not permit the ge of nuclear warheads. He did say his headquarters, which includes three bases, "had plans" to move and prepared to move.

Also on the military-political front, he that his C-130 cargo carriers had run high-altitude missions into Berlin, one March and one in April, contrary to et edicts, and that he thought the should run them regularly to prepare an airlift if one is necessary. The Russian fighters mildly harassed the first flight, did not bother the second.

He added: That Germany would be too close for IRBM's. (The German minister of defense once remarked: "You don't put artillery in the foxholes of the ground forces"). That 700-mile ballistic missiles for NATO nations would be most welcome, especially since the *Mace* program has been knocked back $100 million by the House. That the F-102, of which he has thus far one squadron stationed at Bitberg, will carry both the *GAR-1* and the *GAR-11 Falcon*. The *GAR-1* is conventional but the *GAR-11* packs a nuclear punch.

Germany Would Make *Hawks* Under License

ERDING, GERMANY, Hqs. Luftwaffen Gruppe Sud—West Germany is not working on a defense against the ballistic missile because it believes this is a NATO problem but German industry is working on a radar defense against low-flying aircraft and has made some progress, according to Brigadier Johannes Steinhoff, deputy chief of staff for operations, Ministry of Defense.

At this headquarters of the German Air Force Group South, the Luftwaffe ace whose face is badly scarred from a Messerschmidt jet flameout and crash near the close of World War II, said:

The German government is working to lift the restrictions of building missiles (now limited to two meters in length and 30 centimeters in diameter) so that Germany can manufacture the Raytheon *Hawk* under license: that Messerschmidt, Heinkel and Dornier have formed a combine to manufacture the Lockheed F-104 in Bavaria. Germany will buy 66 F-104's direct from the Lockheed plant, plus 20 two-seat trainers. They plan to manufacture about 250 in southern Germany. The Air Force controls all air defense, even including ack-ack, and will operate the three *Nike-Ajax, Nike-Hercules* battalions it will get from the U.S. These units have already been trained in the States and the first battalion (*Nike-Ajax*) will be operational in the spring.

That one German unit is already in training for the *Matador;* that the French Fouga-Magister trainer will replace the U.S. T-6 and that the Italian built (Fiat) G-91 will replace the U.S. Republic F-84 as an interim combat fighter plane until the F-104 enters GAF service, probably in 1961-62.

That under Germany's depot system, the GAF does only about 20% of its maintenance with the other 80% being farmed out to industry. That the GAF gets its equipment from three sources: grant aid from U.S., purchase from USAF and purchase direct from the U.S. manufacturers. Germany will shortly begin paying most of its own way, one of the reasons the GAF is holding up a decision on purchasing the Republic F-105. It is too expensive to buy and maintain. This deal is not completely cold, however, and some arrangement might be worked out, including European pool manufacture.

There are about 40,000 total personnel in the GAR now. It is expected to have about 100,000 with 20-22 wings, half tactical and half defense, by 1963-64. All units will be committed to NATO.

French Atomic Complaints

LAHR, GERMANY, Hq. First Commandement Aerien Tactique (C.A.TAC) —The French ban on atomic storage for missiles and aircraft also extends to French NATO units stationed in Germany, Maj. Gen. Raymond Brohon, commander, said here. The urbane French officer, who flew with the RAF during World War II and who spent four years in the Pentagon on the NATO Standing Group, also somewhat bitterly echoed the words of his chief, Gen. deGaulle, regarding the U.S. restrictions on atomic information exchange.

"You are refusing to give your allies what is known to your enemies," he said.

He also thought that France, when able to produce its own atomic bomb, might carry out testing (in the Sahara desert, perhaps) regardless of any agreement which might be entered into by Russia, the U.S., and Great Britain.

General Brohon also felt:

That using the F-84 (an old lady) by his forces for the next two or three years would be a waste of the human element. (His pilots are too well trained for that). That he would like the F-104; that he now has 1.2 pilots for each plane and wants the NATO standard of 1.5.

That C.A. TAC will soon have four batteries of *Nike-Ajax* air defense missiles. He has no roles and missions problem. All are controlled by the Air Force although he had to request personnel from the French army to man three of the batteries. That in spite of the fact some of his French NATO units are deployed in Algeria, C.A. TAC maintains 10% of its force on 15-minute alert during non-working hours—more, of course, during the working day.

—reviews—

HYPERSONIC FLOW THEORY, Wallace D. Hayes and Ronald F. Probstein, 464 pp., $11.50.

What started as an 80-page review paper has grown into a formula-packed, amply illustrated book on the fundamentals and present state of knowledge of hypersonic flow theory. It is aimed at research workers and students as a text in graduate courses and serves as an introduction not only to HFT but also to modern approaches in theoretical aerodynamics in general. However, a course in gas dynamics or compressible fluid theory is prerequisite.

Subjects covered include small disturbance theory, constant-density solutions, theory of thin shock layers, other methods for blunt-body flows, other methods for locally supersonic flows, viscous flows, viscous interactions, and free molecule and rarefied gas flows.

TARGET FOR TOMMOROW, Dr. I. M. Levitt, Fleet Publishing Co., New York, 328 pp., $4.95.

Dr. Levitt, director of the Fels Planetarium of Franklin Institute and contributing editor of M/R, starts with what is and then essays to predict what's next in the unfolding of man's space goals. Beginning with an analysis of rocket and satellite development to date, the book's orbit takes in conquest of the moon, life on other planets, man-made space stations and satellite weather bureaus and analyzes the technical problems involved in space pioneering. Although the presentation is solidly grounded in scientific fact, Dr. Levitt writes clearly, simply and colorfully, painting an excellent backdrop for the coming space drama.

DECIMAL CLASSIFICATION OF ASTRONAUTICS, The Council of the International Astronautical Federation (IAF), available from H. H. Koelle, Chief, Future Projects Design Branch, Development Operations Division, Army Ballistic Missile Agency, Huntsville, Ala.

If you've had trouble—as most people do—in locating astronautics material in your filing system, this classification system could be an invaluable aid.

The classification was adopted by IAF to give astronautical scientists a tool for filing of references, technical papers, preprints and working material in a simple and logical frame of reference. It is specifically tailored for small research institutes, working groups, small specialized libraries, individual departments or laboratories in large companies and, specifically, for the individual scientist and engineer who is interested in keeping up to date in the general field of astronautics and its applications on a broad basis.

west coast industry . . .

By FRED S. HUNTER

A good many secondary power people feel this has been a neglected phase of missile development. "It gets third class treatment," said one. "It's just a component to be put together with bits and pieces we have on hand." Secondary power, of course, is a critical factor—the auxiliary power system caused most of the delay in reaching the free fall stage on the *X-15*—but while it may not have received top recognition in the early stages of missile development, it's moving up the scale now.

Aerojet-General Corp. has designed and . . .

produced an auxiliary power unit for the *Titan* ICBM. It is a hydrazine liquid propellant unit, which feeds into a gas generator, thence to a turbine. It has a dry weight of 95 pounds and develops approximately 30 shaft horsepower. In tests conducted to check the temperature danger level for the first shaft bearing, which takes most of the heat load, Aerojet has operated the unit continuously for one hour and 15 minutes without any noticeable temperature rise. In operation, it has achieved a variation of one fourth of 1% plus or minus in frequency and voltage variation in demonstrating a requirement of 1% plus or minus. This unit is scheduled for installation in lot G of the *Titan*. In the final analysis, however, it is still more likely that operational *Titans* will use batteries for secondary power.

Batteries have won the battle . . .

for secondary power for the *Atlas* ICBM. Wet cell batteries are used in the *Atlas* to drive a Bendix AC inverter. After spending something in the area of $20 million, Convair-Astronautics halted expenditure of further funds for Sundstrand's development of a monopropellant power system for the *Atlas*. Sunstrand had come into the *Atlas* secondary power picture through its purchase of the American Machine & Foundry Co.'s Pacoima division. Latter had been working on a bipropellant system for the *Atlas*. Sunstrand changed to monopropellant after it took over. Convair is buying silver salt batteries from Yardney Electric, The Eagle-Picher Co., the Cook Co. in Denver and AMF. It wants a battery with indefinite shelf life.

The DC-3 of the target drone field . . .

might be a good way to describe the OQ-19. The Radioplane division of Northrop Corp. has been turning out OQ-19's since 1946. It is nearing production of its 50,000th target drone and the end is not yet in sight. Currently, it is in production of more than 2150 OQ-19's for the Air Force. This contract, including spares, comes close to $6 million and deliveries run through November. For the Army Signal Corps it is building 612 SD-1 surveillance drones, and these are reworked OQ-19's. Currently being flight tested at El Paso is the new RP-78, designed for improved altitude and higher speed performance. It employs the OQ-19 control system.

Employment increase from 10,000 to 12,000 . . .

is projected at the Autonetics division of North American Aviation in the next 12 months. Among the bigger Autonetics programs is guidance for the *Minuteman*, the forthcoming solid-propellant ICBM. But the big show on *Minuteman* right now is the mobility program. This stems from the Strategic Air Command, which recognized the need for mobile launching for the *Minuteman* to supplement the underground launching sites originally planned.

Most indications are that about one third of the *Minuteman* striking force will be mobile by rail, truck, barge or what have you. New contracts are ahead, and they may be among the biggest expenditures of the entire *Minuteman* program (M/R, June 1, p. 19).

The Navy may have a requirement . . .

for a turbofan engine in the 9000 to 12,000-pound-thrust area for the missile carrier in the *Eagle* project.

SENTER

Maj. Gen. William O. Senter, director of Procurement and Production at Headquarters, Air Materiel Command, for the past two years, will leave Wright - Patterson AFB for an assignment in Washington, D.C.

Maj. Gen. Waymond A. Davis was promoted to that rank from brigadier general to succeed Senter. Davis was AMC's deputy for production. Also announced was appointment of **Col. Henry MacDonald,** AF *Jupiter* Liaison Officer at Huntsville, Ala., as AMC's dep-

DAVIS

for production.

Gen. Senter will become assistant dep chief of staff, materiel, at Headrters, USAF.

Earlier, announcement had been made Davis would become director of ls and Programs. According to AMC, e orders have now been revoked, and ouncement of the officer to fill this tion will be made later.

The Director of Procurement and Proion at AMC is responsible for comon of Air Force purchases which age close to $10 billion a year.

The Lockheed Electronics and Avionics sion (LEAD) has filled two major neering management positions.

Paul F. Pearce was named manager of ect engineering and **Gunnar Wenner**e will head product development. e ce joined LEAD with an extensive a ground in managing the design and e lopment of electronic systems. Wenerg's electrical engineering career s 17 years including a decade in varieengineering management capacities at e.

Callery Chemical Co.'s newly established West Coast office, part of an expansion of its Defense Products Department, will be headed by **Dr. Robert G. Brault.** With Callery since 1954, Brault formerly was supervisor of subcontract research and coordinator of

BRAULT

nig-energy fuel projects at the firm's Re arch and Development Laboratories n allery, Pa.

"Determination to consolidate an important position for itself in the field of missile weapons systems, and to become a major subcontractor for U.S. missile work," is behind organization of a new missiles and systems division and appointment of **Robert D. Richmond** as vice-president of Canadair, according to the company. Richmond, formerly chief engineer of special weapons, will head the new division.

This move follows eight months after termination of Canadair's *Sparrow* missile program.

The new division, Canadair says, is set up to be "strongly competitive with United States sub-contract firms and thereby gain a share of contracts which are made available to Canadian companies under the production sharing arrangements which exist between the two countries."

William C. Benson, newly named project engineer, ground support equipment, for Solar Aircraft Co., came to the firm from Beech Aircraft Corp., where he was manager of support equipment sales. His appointment is part of a program to "bolster Solar's capabilities in the growing area of ground support and handling equipment."

BENSON

George E. Smith who has a 20-year background in manned aircraft, pilotless bombers and ballistic missiles, has been named general manager of The Martin Co.'s Cocoa Division at Cape Canaveral, Fla. Smith succeeds **G. T. Willey,** recently named vice president and general manager of Martin's Orlando Division.

SMITH

Smith will direct the company's test operations and related activities at the Atlantic missile range.

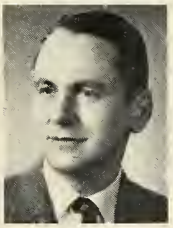
Maj. Gen. E. Blair Garland, USAF ret., will join Philco Corp.'s Government & Industrial division as manager of a new military communications group.

This special technical unit will handle Philco's 19-million-dollar AIRCOM (international communication system) modernization contract from the Air Force and similar contracts.

Philco also named **Henry E. Hockeimer** as AIRCOM project director. New AIRCOM staff members are **Donald B. Clyman,** administration and services manager; **Morton L. Long,** engineering manager, and **John Pell,** installation manager.

Martin E. Dykeman will direct a program to broaden applications of glass, ceramics and Pyroceram materials in aircraft and missiles for Corning Glass Works' New Products division.

DYKEMAN



The aircraft and missiles group formerly concentrated almost exclusively on materials and process development.

Dykeman has been with Corning Glass Works for 19 years, most recently as a sales engineer handling optical products such as glass infrared missile domes.

German scientist **Dr. Herbert Kromer** is Varian Associates' latest addition to the Central Research team organized last year under **Dr. Louis Malter.**

Krömer will be senior research scientist. His nine years of experience in the semiconductor field both in the United States and abroad include several years as a research physicist in the semiconductor group at RCA laboratories, Princeton, N.J.

Appointment of **David Y. Keim** as chief engineer-Military Products of Stromberg-Carlson's Electronics Division has been announced. Keim previously was Engineering Department head, Microwave and Electronic Equipment, Sperry Gyroscope Co.

KEIM

Dr. Earl L. Steele, a physicist expert in semiconductor devices, has been appointed assistant manager of the development laboratory for the semiconductor division of Hughes Aircraft Co.'s Products Group. Dr. Steele, formerly research chief for Motorola, Inc., is the author of many technical papers on diodes, transistors, and rectifiers, and is an editor of the IRE Transactions on electron devices.

CHERNIAK

George S. Cherniak has been appointed Director of Space Technology Laboratories, Inc.'s Flight Test Operations at the Atlantic Missile Range, Cape Canaveral. He was formerly head of STL's *Atlas* Project Office at the Cape.

A Personal Invitation to
ENGINEERS

from ROBERT McCULLOCH
President

"If you would like to be a member of a select corps of Engineers, working for an interesting, growing company . . in one of the country's most stimulating areas . . I invite you to write to Temco. Temco's growth is sound and planned, its products are diversified and challenging, our facilities are modern. Every benefit, for you professionally and in good living for you and your family, is here. Below are some of the areas in which jobs are open now."

SYSTEMS ANALYSIS & DESIGN

Graduate Electronics Engineer or Physicist to perform theoretical electronic system analysis and design of new projects in the missile and electronic system field. He will be responsible for analyzing the customer's requirements and establishing basic as well as overall design parameters to be followed throughout the development of the project. The System Design Engineer will consider the various operational aspects of the system, including environments as well as collateral and concurrent effectiveness when used with related systems.

GUIDANCE DESIGN

Graduate Electronics Engineer or Physicist to perform design and development of circuits and components necessary to the optimum functioning of missile guidance systems. He will design transistorized pulse and video circuits for use in missile and other electronic system projects. He will be responsible for developing applicable circuitry, working from specified and/or general requirements laid down by the particular system concept as dictated by the needs of the customer. The field of emphasis will be in the development of radar techniques.

propulsion engineering

Aluminum welding problems? . . .

Air Reduction Company's new book on aluminum won't solve all your problems, but it'll point you in the right direction. The 116-page book covers all aspects from aluminum history and familiar welding problems to state-of-the-art and unusual problems that missile and aircraft people might encounter. Examples of the topics discussed: joining aluminum, the whys and why-nots; aluminum alloys, their classifications and characteristics; the basic welding processes, each covered in detail.

Equipment for aluminum welding . . .

is discussed in the book, also. Air Reduction's staff discusses manual and machine holders, automatic equipment and accessories for the Heliweld process; manual and automatic Aircomatic processes, and their accessories. The book also goes into power supplies for aluminum welding, discusses special products available, and ends on a safety note.

Plastics stable at 1000°F . . .

aren't here yet, but they're on the way, missilemen learned early in the month at Wright Air Development Center's symposium on high-temperature polymers. Missilemen also learned that the most promising polymers in this field, not surprisingly, are inorganics.

High-temperature plastics are experimental . . .

and they will remain strictly laboratory curiosities for some little time, the Air Force says. However, major advances have been made in the past year in this field that is only about four or five official years old. The Air Force, and other armed services, too, want poylmers that can be used as structural plastics, lubricants, hydraulic fluids, and adhesives. They must stand up under high temperature, pressure and friction.

Polymerized oxygen-aluminum . . .

is one of the most promising of the inorganic materials—the one that has come the farthest and is progressing most rapidly, the Air Force indicates. Aluminum-oxygen-based polymers are terrific at high temperatures, one scientist says. However, there's a catch: the fundamental polymer is terrific so far, but now scientists have to find satisfactory side groups which will make the polymer into a usable, finished material. Technically, the polymers are polyaluminoxanes.

New liquid oxygen truck . . .

is available from the Cambridge Company. It holds 2100 gallons, which the Lowell, Mass., firm equates to 234,000 ft.^{3}. The vacuum tank is jacketed with aluminum, cab is plastic.

Ammonium perchlorate output increases . . .

at Pennsalt Chemicals' Portland, Ore., plant as soon as expanded facilities under a $2 million budget jump materialize. Some new buildings already are underway, and Pennsalt says it has started ordering equipment. Company officials won't say how much the perchlorate production will increase, but hint it will be in the "thousands of tons." Sodium chlorate output also will be upped, about 25%.

New fuel cell "is practical" . . .

so says General Electric vp Guy Suits in describing the company's recently announced device. Suits says the cell operates at 60% and higher thermal efficiencies, produces low voltage direct current directly, with no moving parts, from hydrogen and oxygen. He calls it a simple, portable, lightweight, small-volume generator highly reliable for specialty missile and military applications.

Metal coatings process is updated . . .

by Alloyd Research Co. The company has modified and improved an old process for depositing coatings of molybdenum, chromium and tungsten from the vapor state. This makes possible tough, reliable coatings of these metals on intricate shapes.

3,0,000—**Douglas Aircraft Co.**, Santa Monica, Calif., for launching equipment.

31:00—**Diversified Builders, Inc.**, Cocoa, F., for construction of *Saturn* block-house at Patrick AFB, Fla.

5022—**American Telephone & Telegraph C. Western Electric Co.**, for *Nike* spare pts.

60·00—**Raytheon Manufacturing Co.**, Andver, Mass., for test equipment, mechanic inspection equipment, material handig equipment and production equipnt to support second generation *Hawk*.

9·00—**Rheem Manufacturing Co.**, Downey, Calif., for warhead.

8 46—**Western Electric Co., Inc.**, N.Y., f *Nike* spare parts and components (six-tn contracts).

9.50—**Reynolds Electrical & Engineering C Inc.**, El Paso, Tex., for *Nike-Zeus* nifications and additions (power portti).

5 76—**Douglas Aircraft Co., Inc.**, Charlce Ordnance Missile Plant, Charlotte, N., for *Nike* spare parts and compon ts.

3945—**MB Manufacturing Co.**, New Havi, Conn., for one item of vibrator test sem equipment for simulating shock a vibration to missile motors.

9,3—**Greenhut Construction Co.**, Pensaco, Fla., for construction of Model IV B lacher shelter for F/M launch facility aSanta Rosa Island, Eglin AFB, Fla.

6.5—**Hartley Boiler Works**, Montgomery, A., for construction of test tower in Bg. 4619 at Redstone Arsenal.

0,3—**Sierra Oxygen Co.**, Reno, Nev., for 94 cu. ft. of liquid oxygen.

3,7—**Gilfillan Bros., Inc.**, Los Angeles, fo repair parts.

6,9—**West Florida Electric Service Compny, Inc.**, Panama City, for installation of n engine generator set and associated wrk at the Anclote site portion of the Eln Gulf Test Range.

4,·—**Andy Electric Co.**, Andalusia, Ala., fo 500 KW engine generator installation fo Guided Missile Test Range, Site D-3 at Cape San Blas, Fla.

2,3—**Princeton University**, Princeton, N., for design and analysis of experim ts.

0,3—**Earl & Wright, Inc.**, San Francisco, fo preparation of concept plans and dgn for SAC missile facility.

3,5—**Bowen-McLaughlin-York, Inc.**, York, Pa for extension of vehicle engineering se ices.

3,5—**Polarad Electronics Corp.**, L.I., N.Y., fo a spectrum analyzer and microwave fle intensity meter.

3,2—**Raytheon Co.**, Newton, Mass., for elctron tubes.

5,6—**Ryan Aeronautical Co.**, San Diego, fo target missile.

NAVY

230—**Fred A. Haycox Co., Inc.**, Lynnhan, Va., for construction of guided miles school annex, Fleet Air Defense Trning Center, Dam Neck, Va.

90,3—**Sperry Gyroscope Co., Div. Sperry Rad Corp.**, Great Neck, L.I., N.Y., for spcial tools, jigs, fixtures and test equipnt for *Sparrow I* missiles.

31,2—**General Electric Co.**, Schenectady, N., for fabricating and furnishing self-adptive flight control system.

51.0—**Microwave Associates, Inc.**, Burlington, Mass., for research and development in the field of solid state microwave techniques (two contracts).

$96,789—**Lockheed Aircraft Corp., Missiles & Space Div.**, Sunnyvale, Calif., for research and development.

$53,946—**Philco Corp.**, Philadelphia, for high-resolution electronic viewing system.

$40,671—**Arthur D. Little, Inc.**, Cambridge, Mass., for research and development study of proof testing of missiles.

$36,891—**Temco Aircraft Corp.**, Dallas, for planning and conducting wind tunnel investigation program and formulating a method of determining aerodynamic loads.

AIR FORCE

The Ralph M. Parsons Company, Los Angeles, for architect-engineering services in connection with the fifth operational squadron base for the *Titan* weapon system at Larson AFB. Total value of the complete facility estimated at $48,000,000.

$38,900,000—**Airborne Instruments Laboratory, Div. Cutler-Hammer, Inc.**, Mineola, N.Y., for the development and design of airborne electronic equipment. (Other companies assisting with this project are: **Aerojet-General Corp.**, Azusa, Calif.; **Filtron Company, Inc.**, Flushing, N.Y.; **Haller, Raymond and Brown, Inc.**, State College, Pa.; **Raytheon Manufacturing Co.**, Santa Barbara, Calif.; **Sperry Gyroscope Co., Div. of Sperry Rand Co.**, Great Neck, N.Y.; **Sylvania Electronic Systems**, Waltham, Mass.; **Temco Corp.**, Greenville, Tex.).

$5,000,000—**Collins Radio Co.**, Cedar Rapids, Iowa, for construction of communications stations for the Strategic Air Command in California and Massachusetts.

$5,000,000—**Kollsman Instrnment Corp.**, for astro trackers plus associated tooling and test equipment for use with **North American's** *Hound Dog* weapon system.

Computer Equipment Corporation has received its largest contract for the development of an advanced space/time velocity data recording system. (Amount not disclosed.)

$915,222—**Aerovias Sud Americana, Inc.**, St. Petersburg, Fla., for the "rocket run," a coast-to-coast airlift of test missiles and engineering research personnel (awarded by MATS).

$500,000—**Cal-Tronics Corp., Div. of Acme Precision Products, Inc.**, for design and production of a group of automatic production diode testers.

$366,597—**Microwave Associates, Inc.**, Burlington, Mass., for study and investigation of design factors in high-powered gaseous discharge switches, research and development of a high-powered beacon magnetron and microwave tube (three contracts).

$150,000—**Texas Instruments Inc.**, for study of a major semiconductor substate device—the TI-developed ultraminiaturized semiconductor solid circuit.

$139,954—**Cornell Aeronautical Laboratory, Inc.**, Buffalo, for continuation of research on hypersonic flow by means of a shock tunnel.

$138,613—**Union Carbide Corp., Linde Co., Div.**, N.Y., for 33,920,000 cu. ft. of liquid oxygen.

$124,073—**The Houston-Fearless Corp.**, Los Angeles, for production of four camera systems and precision mounts.

$73,165—**Aerojet-General Corp.**, Azusa, Calif., for spare parts kit for AJ10-33 liquid rocket sled engine in support of project WS-133A.

$54,717—**Motorola, Inc., Western Military Electronics Center**, Phoenix, for subminiaturized receiver sets.

$50,760—**Technicolor Corp.**, Hollywood, Calif., for construction of a 70 MM continuous contract printer for the AFMTC Photographic Laboratory at Patrick AFB.

$45,690—**Aerojet-General Corp.**, Azusa, Calif., for nonpersonal services for relining thrust chambers in support of project WS-133A.

$32,000—**Miami Engineering Div. of Miami Shipbuilding Corp.**, for a mobile frequency control and analysis van for use in monitoring frequency interference during missile test operations at Atlantic missile range.

$25,706—**Southern Research Institute**, Birmingham, Ala., for research on infrared spectra of heterocyclic nitrogen compounds.

NASA

The civilian space agency announced that it awarded the following contracts during the month of May:

$7,500,000—**Convair Astronautics Div., General Dynamics, Inc.**, for eight two-stage *Vega* boosters plus an additional *Vega* for captive firing tests.

$5,000,000—**Jet Propulsion Laboratory**, for technical supervision of the *Vega* project, planning *Vega* interplanetary missions, and providing a third stage for *Vega*.

$4,400,000—**Air Force Research & Development Command's Ballistic Missile Div.**, for already authorized space probes. To be used toward firing of *Thor-Able* and *Atlas-Able* vehicles.

$1,000,000—**Army Ballistic Missile Agency**, for advanced research into four areas: (1) Propulsion and propellants (2) Guidance studies involving celestial mechanics of trajectories in lunar interplanetary misisons (3) investigation of thermal properties of materials in space re-entry research (4) effects of space environment on physical and chemical properties.

$660,000—**Aerojet-General Corp.**, for 20 sounding rockets (*Aerobee Junior* and *Aerobee-Hi* vehicles) which can send 150 pounds to 150 miles in ionospheric investigations to be fired from both Fort Churchill and Wallops.

$560,000—**Army Ordnance Missile Command**, for multi-frequency radio beacons to be used in earth satellites investigation of the ionosphere.

$350,000—**National Academy of Sciences**, for financing research associateship program by providing study grants at the graduate and post-doctorate levels.

$300,000—**Jet Propulsion Laboratory**, for research and development on improved tracking and receiving equipment for deep space missions.

$200,000—**Massachusetts Institute of Technology**, for assistance in making technical evaluations of facilities and instrumentation in tracking network for Project *Mercury*, the manned space flight program.

$180,000—**Bureau of Ordnance (Navy)**, for 16 third-stage *Delta* rocket motors, 12 of which would be used in the *Delta* launching vehicles. The remaining four to be mounted on *Sergeant* rockets for high-altitude firings from NASA's Wallops Space Flight Station (Va.) to check out sphere ejection and inflation.

$150,000—**Office of Army Surgeon General**, for medical aspects for the successful *Jupiter* shot in which monkeys Able and Baker were sent 300 miles in space and recovered safely.

$120,000—**New York University**, for study of general instability of stiffened circular cylinders.

$110,000—**Jet Propulsion Laboratory**, for a transmitter to be installed at Goldstone, Calif., tracking installation. The project calls for an orbiting 100 ft. inflatable plastic sphere off which radio signals would be bounced cross-country within the next year.

$110,000—**California Institute of Technology**, for basic studies of cylindrical and conical shells.

Fully Automatic Vibration Systems for Production Line Testing!

LING

SINE-O-MATIC SERIES

Sine-O-Matic Model RP-1/2 (Vertical Case) —Model 6-C Shaker
Ling Model RA-250 Sine-O-Matic, with Model 6-C Shaker, provides output of 25 pounds force. Systems in 100 and 150 pound ratings available in similar packaging.

Ling packaged sine-wave systems can be converted to random motion at any future time for a moderate cost!

- Extended frequency range—from 5 up to 10,000 cps.
- No impedance changing or manual power factor correction required over entire frequency range.
- All components except shaker are housed in single, compact control console, either desk type or vertical.
- Consoles equipped with swivel casters for mobility—can be easily moved, as required.
- Sine-O-Matic systems meet all specifications called for under MIL-E-5272...can be profitably used by *all* equipmen or components manufacturers!
- Fully automatic programming and push-button operation—ideal for production line testing!

SINE-O-MATIC SHAKER FORCE OUTPUTS

Sine-O-Matic Model	Shaker	Rated Continuous Output in Watts	Amplifier Plate Dissipation in Watts	Sine Wave Pounds-Force Vector
RA-250	6-C	250	200	25

to find the means...

Recent contributions of the Aeronautical Division of A. O. Smith include assignments in research and/or production for the Atlas, Polaris, Jupiter, Nike-Zeus and Vanguard projects. A. O. Smith has also helped pioneer heat exchanger design for nuclear seaborne vessels.

A. O. Smith Aeronautical Division continues to demonstrate unique capabilities to work with research and development groups in government agencies and prime and sub contractors in the airframe, propulsion and missile fields.

In three quarters of a century's service to all industries, A. O. Smith has garnered exceptional experience in basic research, welding, metallurgy, heat treating and other areas that delivers a big payload in R&D speed-up as well as establishing sound production procedures.

A. O. Smith facilities and experience are available to any accredited member of the aviation-missile-rocket industry. For more details, call or write —

EXPANDING THE FRONTIERS OF SPACE TECHNOLOGY... IN TEST

Testing is a vital part of every stage in the development of missile and space programs at Lockheed Missiles and Space Division.

The Division maintains one of the most completely equipped test laboratories in the world. Equipment includes: altitude, temperature and humidity chambers; shaker and vibration systems; G-accelerators; and apparatus capable of performing chemical, metallurgical, plastic, heat transfer, hydraulic, pneumatic shock, acceleration, sinusoidal and random vibration, structural, electrical and electronic tests. Static field testing; research and development testing on controls; testing in ordnance and hydraulics and high-pressure gas and propulsion systems are conducted at the 4,000 acre, company-owned test base in the Ben Lomond mountains near Santa Cruz, Calif.

Unique Flight Test Concept—Flight testing is conducted at Cape Canaveral, Florida; Alamogordo, New Mexico; and Vandenberg AFB near Santa Maria, California, in a unique manner. All components and sub-systems of a new project are initially tested on known-performance, production missiles. Thus, when the final system is ready for first flight, its individual components already possess flight-tested reliability. This new concept of flight testing is a major contribution and has enabled Lockheed to produce extremely complex missile systems in record time and at greatly reduced expense.

Underwater launch tests, for the Navy POLARIS FBM, are carried on at the Sunnyvale facility and at the Navy test base on San Clemente Island. These include studies of cavitation, wave simulation and skip motion. In addition, structural and other tests are performed at Hunter's Point Naval Shipyard, California.

Engineers and Scientists—Lockheed Missiles and Space Division has complete capability in more than 40 areas of science and technology. Its programs reach far into the future and deal with unknown and challenging environments. If you are experienced in one of the above areas, or in related work, we invite you to share in the progress of a company that has a continual record of achievement and to make an important individual contribution to your nation's competence in space technology.

Write: Research and Development Staff, Dept. G1-29, 962 W. El Camino Real, Sunnyvale, California. U.S. citizenship required.

Who Owns Man's Brain?

In the Constitution of the United States, a sometimes almost forgotten document in these regimented days, is a paragraph which reads (Article 1, Section 8):

"To promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries."

We bring this up in connection with the important controversy over patent rights accruing under contracts to the National Aeronautics and Space Administration. Hearings were held in Washington recently (M/R, June 1) to permit industry attorneys to express their opinions of, and objections to, patent regulations laid down under the Congressional Act which set up NASA—particularly the manner in which they differed from the regulations governing patents under military contracts.

Briefly, under the military regulation an inventor or a company is entitled to the rights to any invention achieved under a military contract, with the Government holding license rights. That is, the company owns the patent but the Government gets free usage.

Under the NASA regulations, with a few minor exceptions, the Act provides that any invention achieved during work on any NASA contract is the exclusive property of the Government. This applies to prime and subcontractor alike, no matter how far removed.

Further, any person inventing an article which may have a utility pertinent to the conduct of aeronautical and space activities—whether he is a NASA contractor or not—must declare under oath that his work was not related to any contract with NASA before he can get a patent on his invention.

Although this is a nutshell version of the two regulations, we think it shows that the NASA Act opposes completely the principles of both the Constitution and fair practice. We cannot believe that government has an automatic and complete right to the fruit of the by-product labors of its employees, direct or indirect. Nor do we believe that the burden of proof should fall upon the individual—in this case the inventor.

That NASA itself is not entirely in agreement with the law may be judged from a statement by Administrator T. Keith Glennan regarding the conflicts between the rules of NASA and the military. He said:

"Two such contrary patent policies followed by Government agencies working in closely related fields of research and development, can be detrimental to the kind of cooperation that we must have from industry, if our joint effort is to go forward with effectiveness and dispatch. We are well aware of the attitude of industry toward this question. On the other hand, it must be recognized that these rules are written into the law, and we cannot ignore them."

Congress has made it clear that it wants the National Space Act to operate for a while before it makes any changes. We suggest that this should be among the first alterations—and that industry must take the lead in making the situation clearly understood by the law-makers.

Indemnification—Another Problem

While we are on the subject of Congress, industry and space, let's consider another problem which the country must face up to, and fairly quickly—indemnification legislation.

Very shortly we shall have ICBM bases in this country equipped with missiles designed to carry nuclear warheads. Nuclear-armed IRBM's are already on station in England and soon will be in Italy. Very shortly also we shall be testing and launching atomic-powered rockets for spacecraft and atomic-powered aircraft.

It is not inconceivable that in all this monkeying around with a power we really know little about, and even less how to control, some horrendous accident could occur.

Who is responsible? The Government? The prime contractor? And to what limit? Any corporation could easily be wiped out by the claims which might accrue. And suppose the fault could be traced to some gadget, made by a small subcontractor and in itself harmless—except that it malfunctioned. Insurance companies will touch no such case.

Two measures have been introduced in the House which cover the situation to some extent by limiting the responsibility of both Government and industry. But they do not really cover all of the aspects—and they appear unlikely to come up at this session.

This is another problem on which the aircraft/missile/space industry must unite to push for a solution.

Clarke Newlon

A missile streaking through the sky . . . a ship plowing through the ocea . . . a submarine gliding through the depths . . . all guided with unerring a by Autonetics' inertial navigation systems.

Twelve years ago development was under way on the first Autonetics' autonavigator—a system to guide a supersonic missile to a distant target.

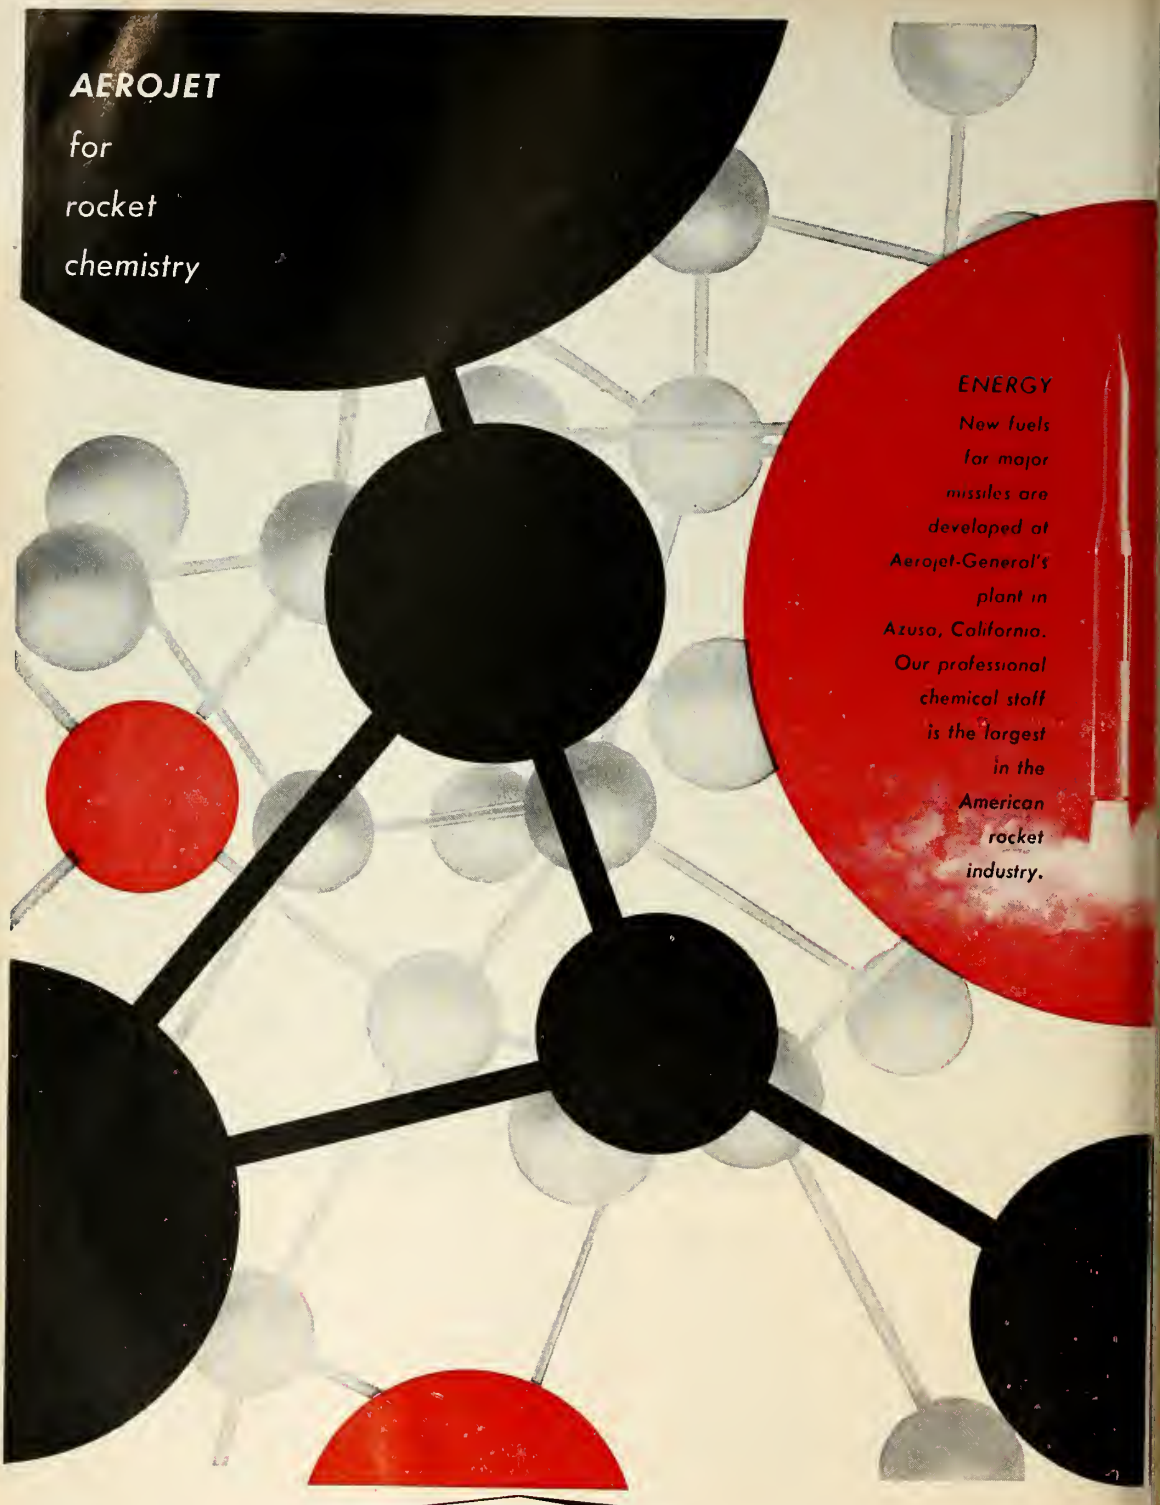
Since then, refined versions of this system have shown remarkable ca for guidance over, on and under the terrestrial surface in any craft, at an under any conditions . . . a significant advance in the state-of-the-art.

It was an Autonetics' autonavigator that guided an aircraft on the first su daylight cross-country flight by stellar-inertial autonavigation. Another

Inertial navigatio

ssed the Navy's exhaustive sea tests aboard the USS s Island in 1957. And in 1958, Autonetics' systems he USS Nautilus and Skate on their historic voyages e polar ice.

Autonetics is producing in quantity the systems to e Air Force's GAM-77 missile. Its engineers are de- systems for America's Polaris-carrying subs and the an intercontinental ballistic missile. Even more d systems will provide the accurate stellar-navigation ded to guide man on his travels through Outer Space.



But the imaginative engineering that brought inertial navigation so far, so fast, is only half the Autonetics' story. New ideas had to be implemented by new manufacturing techniques. Many components of inertial autonavigators—gyroscopes, accelerometers and computer elements—called for precision that was once impossible. Now Autonetics has put it on the production line.

These are the achievements that have given here-and-now reality to inertial navigation... and have made Autonetics first in the field.

Industry Countdown

STRUCTURES

Project Rambler is scratched . . .
NASA rejected the proposal of $1 million-plus high-altitude sounding rocket as duplicating capability of other already well-advanced research programs, such as *Scout*. Embodying new concepts in fibreglass construction and new launching techniques, *Rambler* was submitted recently by a team composed of the **University of Michigan, Vickers, Lear, Sparton Electronics, Wyandotte Chemical** and **Curtiss-Wright.**

• • •

Amputated in DOD's . . .
"master defense plan"—two *Bomarc* bases at Winooski, Vt., and Madison, Wis.

• • •

Don't throw away industrial . . .
security regulations. The program struck down by a Supreme Court ruling last week probably will be reinstated shortly either by Presidential executive order or rush Congressional action. Regulations may be changed to allow alleged security risks to confront their accusers.

• • •

Co-op NATO missile/aircraft . . .
production lineup which appears imminent probably will see Italy making airframes and MSE; France—airframes and assembly; Britain—engines; Holland—electronics; Germany—electronics and heavy equipment; Belgium—support equipment and parts.

• • •

Great Britain is dickering . . .
for purchase of the **Martin** *Bullpup* air-to-surface missile. Whether it will be manufactured in England under license or exported still remains to be decided . . . France is getting ready to spend a reported 16 billion francs over the next six years on space research; may be in the market for hardware. Program, if funded, will be run by National Fund for Scientific Research.

• • •

PMR operating contract . . .
will be awarded by Navy to **Bendix Aviation** and **Texas Transportation Co.** (a new corporation reportedly set up by retired military men.) Contract is similar to **Pan American's** at Cape Canaveral.

• • •

Just revealed . . .
Martin *Titan* skin structure is about 40% magnesium-thorium sheet and extrusions, accounting for about 2000 of the ICBM's total poundage. **Dow Chemical**-developed HM21A and HK31A sheet is used in transitional sections, between fuel and oxidizer tanks and between second stage and nose cone. HM31A extrusions are used for external conduits between fuel and oxidizer tanks in both stages and for internal stringers, longerons and hinges.

PROPULSION

Advancing technology bypassing . . .
boron compounds is apparent reason for Navy's sudden cancellation of $13.5 million sodium borohydride contract with **Metal Hydrides Inc.,** Beverly, Mass. Other materials are offering higher I_{sp} without the handling and oxidation problems of boron compounds. MHI, which had produced 1.7 million pounds of the missile/aircraft propellant under the contract originally due to expire in May, 1960, plans to go into commercial production.

• • •

Powerplant for first *Mercury* . . .
capsule has been delivered by **Rocketdyne** to ABMA. The *Redstone* liquid-fueled rocket engine delivering 75,000 pounds of thrust will lift a capsule carrying animals down a 100-mile course.

ELECTRONICS

Really hot competition . . .
can be expected for **Douglas'** ALBM guidance contract. While early version may be simple command system, inertial is certain to be an eventual requirement. Specs probably will demand a complete digital system for stellar acquisition, interpretation and readout measured in seconds rather than minutes. Manufacturer who produces quickly, therefore, has a lucrative opportunity. Secondary requirement probably will be for versatility in stellar acquisition both in the bird and the launch aircraft.

• • •

Won by RCA . . .
Boeing *Minuteman* electronic subsystem contract . . . and insiders say RCA also will get multimillion-dollar Project *Mercury* tracking due to be announced by NASA July 15.

• • •

Advanced infrared detector . . .
utilizing photosensitive semiconductor energized by microwave electromagnetic fields has been developed by **General Bronze Electronics.** Wide bandwidth unit (infrared through ultraviolet) with parametric amplifier claims sensitivity approaching the theoretical limit.

SPACE MEDICINE

Space-environment chamber . . .
being installed early next year at **Republic's** astronautics research center to simulate conditions for humans 150 miles up, will cost $500,000 and be built by **Tierney Engineering Inc.,** Union, N.J. Chamber will be 14 feet in diameter, 30 feet long.

Washington Countdown

IN THE PENTAGON

Navy's plans for own ALBM . . .

as broken exclusively in M/R (June 22, p. 9) have come under "roles and missions" fire with the order presumably given to the Navy to keep its hands off because it is a "strategic" weapon. Many industry sources say the project has been driven "underground" and Navy now is busy adjusting for "new requirements" which will permit it to enter the ALBM picture. Original Navy thinking, sources told M/R, is that Navy had planned to get its own ALBM into production at least a year before the AF-**Douglas** version by using prototype hardware of some of the companies edged out in the AF competition.

• • •

Demotion of William Holaday . . .

onetime U.S. missile czar, is now all but complete. Holaday has been "relcased" from his post as special guided missile assistant to Defense Secretary Neil McElroy and the post has been abolished. But he remains as chairman of the somewhat strengthened Civilian-Military Space Liaison Committee. Holaday's removal strengthens the hand of R&E Director Herbert York.

• • •

A Far East AF missile base . . .

is being planned for Okinawa. Cost estimated to date: Nearly $10 million. The one-time Japanese base is within easy IRBM and ICBM range of Peiping, Shanghai and the big Soviet industrial and military centers in eastern and central Siberia.

• • •

Next *Discoverer* launching . . .

may be held up while ARPA and Air Force scientists try to find out why *Discoverer IV* failed to go into orbit. *Discoverer V* normally would have been launched toward the end of July. Whenever it is launched, it will be used to check out the *Discoverer* system before any new attempt is made to recover mice after putting them into orbit.

• • •

French nuclear-tipped missiles . . .

may be carried by the Mirage IV—the new French fighter-bomber now under development. The bomber, capable of carrying a nuclear bomb, will have a range of more than 1350 miles—great enough to reach Moscow. Production is 27 months away.

Reconnaissance satellite tests . . .

are nearer than some think. The Air Fo is already constructing test stands for Lo heed's *Sentry* at Vandenberg AFB. It se $14.4 million for *Sentry* facilities. Many c sider the U.S.-Soviet race to develop a rec naissance satellite one of the great battles the Cold War.

• • •

U.S. wants to construct . . .

installations for **Lockheed's** *Midas*—the mis warning satellite—somewhere in Great Brit The Air Force wants more than $19 mill for *Midas* facilities in FY 1960.

ON CAPITOL HILL

Be starred ex-military officers . . .

will not be called to testify for awhile the House investigation of the alleged "mu tions lobby" gets underway. (See M/R Ju 29) First witnesses during the next week so will include Defense Secretary Neil M Elroy, Attorney General William Rogers a members of Congress.

• • •

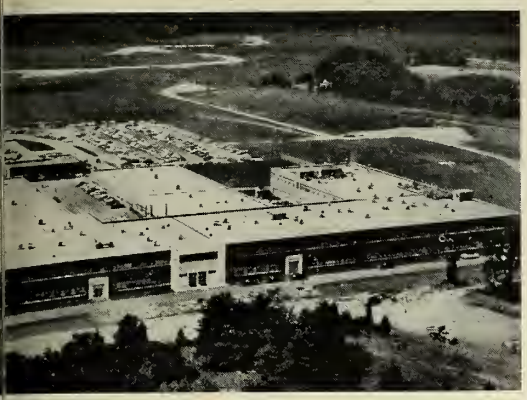
Congress is expected to grant . . .

an extra $137 million for **Western Electri** *Nike-Zeus* program. That will put a total $437 million in the FY 1960 budget for *Ze* The extra funds will be used for producti facilities and pre-production planning. (S page 25)

• • •

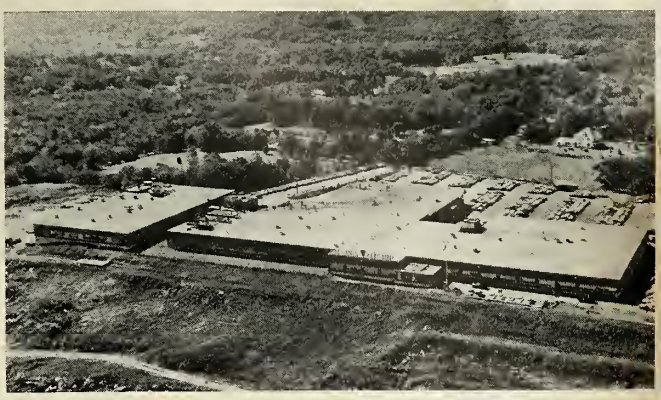
Behind NASA's First Real Fight . . .

with Congress over the $68 million cut their budget is an effort to keep on schedu Project *Mercury's* attempt to put man space. By contacting newspapers, science ar civic groups, and friendly Congressme NASA hopes to re-instill Congress's po *Sputnik* fervor for space projects.



AROUND TOWN

Some of the reports. . .



that are being passed as the "latest" in th nation's capitol:

. . . Governor Nelson Rockefeller of Ne York will emerge in his struggle with Vic President Nixon for the GOP presidenti nomination as the foremost advocate for "Bi Defense."

. . . The long-range tide in defense plan ning is turning away from massive retaliatio in favor of greater preparation for limited wa

THEON'S plant at Wayland, Mass. This company, prime actor for *Hawk* and *Sparrow*, is area's top missile employer.

SYLVANIA'S engineering and research facilities at Waltham, Mass. Firm also has one plant location in New Hampshire.

New England's Missile Boom

The Northeast's $1 billion-a-year-plus business —first in a series of regional surveys

by William E. Howard

BOSTON—A missile/space manufacturing boom born of scientific brain-power is surging through New England's economy.

All over the six-state area, hard-hit a few years ago by a mass exodus of textiles, there is a fever of activity. The region now has more than 600 electronic manufacturing firms with a product value topping $1 billion—5% of the entire nation's output. There are an estimated 76,000 electronics employees receiving $290 million annually in wages.

Approximately 2600 firms are engaged in missile/aircraft component production, supplying parts and subsystems for virtually every missile/space project. The work force in this field runs into the tens of thousands.

In addition, New England houses some 600 basic research and development firms, big and little, which have additional thousands of scientists and technicians intently exploring new horizons in astrionics, propulsion, nucleonics, astrophysics and related sciences destined in the driving new missile technology.

• **One billion and growing**—What's the scope of the missile industry, as such? Experts on the New England Council for Economic Development estimate that the Northeast's missile volume is well over $1 billion and the figure is still growing.

So fast has the growth been that officials are hard put to come up with any definite figures. But their estimates indicate that upwards of 150,000 persons throughout New England are hard at work in the field.

Eighty percent of the $1 billion electronics manufacturing in the region is believed to be missile-related. Pinpointing where the activity lies, though, is difficult. Many companies are strictly components producers supplying both consumer and military markets.

From wave-scoured shores of Maine to the exclusive exurbanite sanctuaries of southern Connecticut, new plants are sprouting behind scenic old fieldstone fences and in dozens of brand new industrial parks. Around Boston, hub of electronics and R&D, carpenters and masons are rushing to complete more than $50 million of new construction to meet a seemingly never-ending demand for more space for production and laboratories.

Not to be overlooked are New England's clanging shipyards. They are turning out missile cruisers and frigates and *Polaris* submarines under contracts running into the hundreds of millions of dollars. The region is also heavily dotted with defense installations—SAC, SAGE and Navy bases and other facilities that keep a legion of suppliers busy.

Under construction way "Downeast" at Cutler, Me., for example, is a $64 million VLF Navy radio station for *Polaris* FBM submarine communication.

• **Raytheon largest**—The area's biggest single missile employer is **Raytheon Mfg. Co.**, which has two prime contracts—the Army *Hawk* and Navy's *Sparrow III*. This week it was awarded a $161 million contract for more *Hawks*. More than half of the company's 35,000 employees in New England are in defense production and more than 3000 are working in the Missile Systems Division plants located at Lowell, Tewksbury and Billerica, Mass. This Raytheon division alone farms out an estimated $10 million to more than 600 Massachusetts subcontractors.

As the nation's only electronics company with two prime missile contracts, Raytheon going into 1959 had a backlog exceeding $300 million. The company has added 6000 employees since Jan. 1, 1958, and is preparing to hire another 1,500 to 2,000 to man a new ASW plant to be constructed at Portsmouth, R. I.

growth reported in six states . . .
